I can't believe it.. I'm talking to the person who actually MADE the
famous Atari bombs, prolly the most successful Atari program ever which
has even made it to various Linux screensavers? :)))

Well the sad mac is certainly funny but I must say I'm glad you came up
with something original. :)

Maurits.

Ok, I'll take your word for it.
So then, _is_ there any relationship at all between them...?

>>The special access requirements for the Falcon's 24bit address map
>>is not something that the PPc was designed to handle. There will
>
>Why would the address bus be a problem?

I didn't speak of the bus, but of the map, which contains a lot of
Atari specific peculiarities. Just to mention one small example:

The lowest 8 bytes are ROM not RAM, and should therefore generate
a bus error at all write attempts. The built in decoding of the
Falcon is not fast enough to tell the PPc about it in time, and
normal MMUs do not have so fine resolution in page size, so some
extra hardware must decode this and generate the signal.

For significant acceleration it also becomes necessary to bypass
much of the Falcon's original decoding, and the signals for that
must also be generated by extra logic. It is not realistic to
say that the PPc just has to be connected to the Falcon bus with
no adaptive logic. That would not give satisfactory results.

>I can assure you that there are many PPCs around with less than
>16 Mbyte addressable RAM.
>The 24->32 bit extension of the hardware addresses can easily be
>handled by an MMU.

Yes of course, that is not the problem.

>The 16 bit bus and eight bit hardware registers may well be a problem,
>though.

That, yes, plus the fact that many hardware registers are based on
triplets of bytes to form 24 bit addresses etc. These are not normal
ways of doing things in a machine with 32 bit busses, such as the
PPc was designed for.

>>That sort of situation can be very unstable nowdays. If no
>>new 'big platform' designs are made based on them, they can
>>rise very rapidly in price as the existing supply runs out.
>>This has happened before with other chips.
>
>The chip used on the Tempest is only a few months old.

Oh, then he was misinformed on that subject too.
As I myself am not familiar with PPc stuff I had no idea about that,
but then I suppose his argument for a really low price falls anyway.
Recently designed chips are usually quite expensive at first.

>According to other posts here, Apple's emulator seems to do about
>four times better than that on a 300MHz 603e...
>(10-15 times a 32MHz '030)

Goody, though it does sound a bit high to me, and it can only apply
to 'raw' CPU power anyway, as even SDRAM has limits in access rate.
I still think we have to wait and see what real benchmarks on the
finished product tells us.

>finer grained control.

That is one way of doing it, and I can think of others too, but the
big question here is not what can be done. It is: are they doing it ?
When a guy who claims to be well informed on a product only 'hopes'
that it might be done eventually, then I assume that it is not part
of the current design.

>A PPC program that wants to call 68k TOS could easily go via a
>'glue' routine that does the call under 68k emulation.

Yep. There are lots of ways to handle such context switching.
But if the design is not made with this in mind, then it can hardly
be added by just anyone who feels like it, because it would require
disassembling and patching the 68030 emulator.

>>>could lead to a number of much faster programs designed for
>>>the PPc chip that don't use emmulation.
>>

>>I doubt that this will ever become powerful factor for the TOS
>>platform. This is inherently based on 680x0 code, throughout
>
>So was the Amiga market and they seem to like their PPCs.

I never said people would dislike it in the TOS market, but only
that I don't think it will ever be a powerful factor. On Mac and
IBM PowerPC systems the situation is different, because they have
massive commercial support.

>>Native mode might play some role anyway, for superoptimized
>>NVDI drivers and such things, but hardly for GEM applications.
>
>Not any of the commercial stuff, perhaps, but that wouldn't
>bother me much.

I feel the same way, but the other guy did speak of PPc APPs
replacing 68030 APPs in general, which I deem unrealistic.

>>Just developing/porting the tools needed for that would take
>>years. (Compilers, assemblers, debuggers, etc.)
>
>Just do a PPC cross-compiler of GCC and you'll have C, C++,
>Fortran and Ada. ;-)

What good is a raw compiler without the support libs for the
new machine ?

It can be used for developing optimized drivers and the like,
as I assumed earlier, but no major applications. And it is
not just a question of writing new libs, as a PPC APP would
also need PPc compatible system routines, which don't exist.

A hybrid lib is possible, switching back and forth between
native and emulation mode (to use gemdos etc), but it would,
as I said before, be a major development project in itself.
And it would be a nightmare to debug it !

>Debuggers may be a bit of a problem, though.
>
They would also be a major problem, that is true.

----- snip ----- re: running PPc parallel with 68030

>along in its caches, though and it seems likely that the local RAM on
>the Tempest can be accessed without touching the expansion port.

Agreed, but what can it do then ? The running software has reached a
point where access on the Falcon bus is needed, so what _good_ does it
then do that the tempest can access internally. It can't even service
any system interrupts, as those arise on the Falcon bus and will be
seen and handled by the old CPU when that is bus master. And that in
itself is a very serious problem, as we want interrupt sevice to be as
fast as possible, which it then will not be.

>>2: There is no way that existing system software can survive
>> parallel use by two independent processors. This would
>> lead to total chaos in the use of system variables and
>> stacks etc.
>
>So, don't allow both to do system calls at once.

It is not just a matter of not making system calls at once.
There can't be two parallel CPU's using a normal gemdos system at all
even if they do take turns. The whole system would have to be rewritten
for parallel use to allow that.

VDI and AES were written to support parallel use. That is why they
have all those APP-specific arrays. BIOS, XBIOS, and GEMDOS were
written for singletasking singleCPU use, and that is not easily
changed. MagiC and MiNT have managed to get around the singletasking
limitation, but they are still not capable of multiCPU usage.

>>3: It would also lead to partly parallel address spaces, making
>> all pointers from ST-RAM to FastRAM ambiguous.
>
>Hmm. I don't think I follow you there.
>Why would the address mapping ever need to be changed (assuming
>no virtual memory). The '030 would very likely not be able to
>do anything with the Tempest memory.

He was not speaking of the old 68030, but of the CPU on other
accelerators, that have FastRAM. That is why I replied as I did.
Perhaps you missed the point where he claimed that old accelerators
could be kept in the system after installing tempest ?

>>I could go on but why bother ? Meaningful parallel processing
>>requires an operating system designed for that, which TOS isn't.
>
>It's very easy to think of parallel processing jobs that don't
>require any OS support at all:
>- compilation (from a non-system RAM disk)
>- image processing/rendering
>- HTML formatting

And how then do you make a CPU that may not use the operating system
at all obey your commands ?

Believe me, trying to let the old and slow processor work safely in
parallel to the main tempest CPU will cost so much extra ST-RAM access,
that all the work savings the old processor can provide will not repay
the losses, and much less gain us anything.

And trying to keep any old accelerator board is a ridiculous idea.
There is no way to integrate all variants into such a system in a
compatible way.

>>Remember, we are not talking of all potential Tempest users here,
>>but only of such users that also have a suitable other accelerator.
>
>But everyone will have their old '030 too.
>Not that it would be terribly useful to run that in parallel with
>the much faster PPC, though.

Precisely. To make the old CPU do anything at all safely will cost
much more time than it will take for the PPc to do the same work.

>>Finally, I believe that the overall system would gain *more* speed
>>by working for optimized integration of the PPc with the Falcon, and
>>that requires skipping any extra accelerators as they would only
>>worsen the 'bottleneck' effect of the interface between Tempest and
>>Falcon.
>
>I'm pretty sure all accelerator boards just supply the original
>expansion port, without any extra hardware involved.

I was not talking of extra hardware here. The mere fact that another
CPU also runs as alternative bus master creates an effective bottleneck.

As the PPc is so much faster than the older stuff, they should not ever
be allowed to stand between the PPc and immediate system access. That
is why I say they should be skipped, to allow the PPc to be 'integrated'
with the Falcon, in the sense of having total control over it.

Think about it.

>>Talk is easy, but development requires suitable tools.
>>We have no such tools today for producing native PPc code.
>>They do exist on other platforms, but not with support for
>>TOS and GEM. Just porting libs would be a *major* project.
>
>The MiNT libs etc are mostly C code.

Sure, but they refer a lot to system calls that do not exist
for PPc. Those libs are no good without a PPc MiNT kernel.

>>the TT has full 32 bit busses for both address and data, and
>>the internal speed of a TT is therefore near four times that
>>of a normal Falcon.
>
>The busses are indeed 32 bit but, IIRC, only the actual processor
>on the TT is 32 MHz. The rest of the system is 16 MHz.

So what ?
It is the CPU which performs the bus accesses and executes opcodes.
As long as that is done at 32 MHz I call it a 32 MHz computer.

Just as the standard Falcon is a 16 MHz computer, even though various
other chips than the CPU use clocks that are higher or lower than that..

>I've certainly never seen a TT come close to four times the speed
>of the Falcon on anything.

Then you have never used a normal Falcon at high VGA resolutions.
(Without a graphics board I mean.) VIDEL steals a lot of time
when using VGA compatible timing.

If VIDEL uses PAL compatible timing, and the TT lacks TT-RAM,
then the factor will likely be far below 3. With TT-RAM
however (which all TTs should have) it will be higher, and
if VIDEL uses VGA timing for high resolutions, then the
factor can be a lot higher than 4.

That is the main design weakness of a standard Falcon, that
VIDEL blocks the CPU not only from updating screen, but also
from accessing anything else in ST-RAM when VIDEL is doing an
access burst, and in high resolutions that happens *often*.

----- snip ----- re: lack of advanced support for our platform
>
>Well, perhaps we could port BasiliskII. ;-)

Actually I'm not familiar with that, but I won't rule it out.

My main point, which you seem to agree on, was that we can't
expect to get 'for free' any Mac or IBM support just because
the Tempest uses a related processor. If anything is to be
ported, it is indeed 'we' (meaning the Atari user community)
that will have to do it.

>very reliable).

The latter methods are probably not effective, as they could easily
waste most (all?) of the time gained by caching. Your first method
is effective, but risky. Some APPs will not work well with it.

>The only ways this could cause problems are if the application needs to
>access the first to words for some reason or if the image is modified
>without disturbing those two words.

'for some reason' is a wide range, so let's just agree that there are
cases when the 'marks' will be erroneously used as if they were image
data, and that the APPs that suffer from this are not suitable for use
with this caching method, and the same naturally goes for those that
make partial image updates. (eg: for animation of some image)

>For icon sized images I really don't think this is likely, but for general
>images it might happen. If it does, just turn off the feature and live
>with the slowdown.

That is one way to do it, but if most do this, then the code serves no
real purpose.

>(It would be possible to make this selectable per virtual workstation.)

That would be a better way to do it, although there would have to be some
clever mechanism for making this 'automagical'. Possibly similar to how
WinX allows selection of some AES characteristics based on known APP names.

>>As I see it that sort of thing can only be done by newly defined functions

>case loose data, which couldn't happen with the original OS
>implementation.

Except that computer turnoff is a much less frequent operation than the launching of various APPs, without knowing beforehand if it will 'like' this VDI feature. Your idea of enabling this feature per workstation could be the best solution to this. Then the user can easily eliminate future such problems for a given APP when any such problems appear.

>I agree that there should be a new VDI function to do cached blits, but
>there's little chance that many programs would use it and this way many
>people can get most of the benefits where they are most important.

Good point, and the 'per workstation' idea is probably the key to doing it safely.

>If there is a problem with one of your applications, turn the feature
>off and let me know about it. Perhaps I can devise a workaround.

I think you already are on the right track with the method discussed above, provided that you expand on it a little more.

----- snip ----- re: modern icons are not fixed in their sizes
>

>be slightly more difficult than different heights, but still not very hard.
>I may do something about this at some point.

Free icon sizes do add some complexity, but it should not be very hard, especially in the kind of system where you plan to add caching of all kinds of bitmaps. The added complexity to keep track of image sizes will be needed for that as well.

>>On my homepage you can find an extreme case of 'micro' icons intended for
>>use with the normal Atari 'NewDesk'. These icons are only 1 pixel high,
>
>Icons that small would hardly be worth caching, anyway.

No, of course not. In fact they are not intended to be displayed at all ;-) That one row of pixels is always blank ($0000).

I really wanted a height of 0, so as to get a pure text label without any icon image data. But the desktop routines do not like icons that have zero size, so I had to use a height of at least 1 pixel.

----- snip ----- re: allocating desktop buffer in FastRAM added by Maddalt
>
>That shouldn't matter since the programs in the AUTO folder are all run
>before the AES starts and I'd assume a Maddalt program would run there.

Yes.

>The buffer definitely ends up in FastRAM on an AB040.

Good.

----- snip ----- re: rules for allocation of VRAM memory
>
>I thought you were talking about rules for how applications could
>access the memory themselves.

Not at all. There I agree with you. Memory is memory, and as long as
they keep inside their allocated areas they can access it whichever way
they like.

>>RAM whenever they don't really need it, to give other APPs a chance to
>>improve their performance by using it. This can't be enforced at driver
>>level, since the needs vary for different APPs, so it will have to be
>
>It could probably be handled by some kind of caching scheme.

To some extent it could, but that kind of caching can cost time too,
so really abusive APPs could still ruin the efficiency. And the author
of it might not even realize it. That is where programming rules help,
telling programmers how a specific resource must be used to function
well.

>>enforced through a set of programming rules.
>
>I wouldn't call that rules. Perhaps guide-lines is a better word.

Rules and guide-lines are closely related, but as I see it 'guide-lines'
are collections of good advice, whereas 'rules' are definite orders.

So, "The 'Quit' command should be in the 'File' menu." is a guideline
But, "System vector bending requires XBRA protocol." is a rule.

With this definition any rule is also automatically a guide-line, but
guide-lines in general are not usually rules.

>Anyway, it isn't as if it's likely that a whole lot of applications are
>ever going to use these features. ;-)

Perhaps not, but it only takes two to have conflicting needs.

----- snip ----- re: blitting monoplane images to multiplane destinations

>>That is bound to be less efficient, since it means repetitive CPU code

>The mach64 engine is set up to take everything it finds there and blit
>the corresponding pixels in whatever graphics mode I've set.
----- snip ----- re: the rest of the mach 64 blitting example

In other words. Your code writes data to the board once, and the board's
graphics processor does the rest of the work just as I suggested. The

only difference is that I did not mention any 'host port' as I was not speaking of any specific board.

This is a clear case of a mutual misunderstanding, since we both want the job done in essentially the same way, which is to say that the CPU writes data to the board and the graphics processor copies the data into the various bitplane destinations.

>>Well, I'm not so familiar with fVDI internals, or NVDI internals either,
>>but I assume that both support loadable drivers that allow omptimization
>>of such things to be added by third-party programmers. If so, it should
>
>Yes.

Good. Given the present situation on the TOS platform there are a large number of major system enhancements being maintained by single authors or in some cases very small groups of authors, that are obviously having difficulties providing wide support.

Loadable drivers, with freely available specifications, is one of the ways to allow more participants to contribute to such enhancements, with wider support than the original author can provide.

>>only be a matter of getting the necessary programming docs out to those
>>programmers that are familiar with the graphics cards needing support.
>
>Of course. Only such documentation has never been available to the
>public when it comes to NVDI. I have asked for it myself.

That is bad. In fact it is even stupid. If more people knew how to code NVDI-compatible drivers, then all graphics cards for the TT would have such drivers. And then all TT users with such cards would also become NVDI users, which many of them are not today, lacking such drivers.

I fail to see why the Behnes would be against having more customers.

I'm not sure what the situation is with graphic boards for Falcon, but if they won't share the information, then NVDI will only be used for those boards they have time to support themselves.

>>After all, the 680x0 series is also descended from early 8 bit CPUs.
>
>Perhaps in some minor ways, but there isn't much in common between the
>68xx and 680x0 processors.

In details there are very few similarities, because Motorola (unlike Intel) realized that none at all were needed. The great similarity is in the philosophy and general structure although implemented on different scales.

The main similarity is that all Motorola CPUs have been designed to use a set of addressing modes symmetrically for a set of instructions, so as to reach an optimum of usefulness. This is an oversimplification of course, but this is the basic idea.

That is the main difference between Motorola and Intel, who ignored the need for flexible and consistent addressing completely in all their early processors, concentrating instead on complex ways of manipulating the CPU registers.

When the time came to make 16bit processors, Motorola stuck to their idea of consistent addressing, and extended it to also cover internal register access, thereby creating the 68000 CPU model.

Intel on the other hand decided to keep their complex register set more or less intact from the older processors, just adding some more of them and a large number of complex instructions with highly inconsistent addressing modes, both for internal registers and external memory. And this became the 8086, whose weaknesses still handicap more modern Intel CPU's.

So both companies have remained true to their original ideas, although newer CPUs naturally differ a lot in how they implement those ideas, as compared to how it could be done in the early days.

Source record: 77799

Hi there!

Sorry, I dont now much about this newsgroup - maybe I am off topic here...

I neither have time nor space in my room for my computer stuff anymore

What I have is:

Atari Mega STE (without case)
Atari 1040 ST
Atari 512 ST (without case)
Afterburner with 040 (Cooler,Software)
Atari Junior Prommer + Software
Romport-cardridge Megaripper
Romport-cardridge for Eproms (you can burn with Prommer)
PC-Keyboard-Interface
Amiga 500 (with memoryupgrade -> 1mb)

2 x Jaguar game-paddles
2 x Logitech Pilot maus
1 x Alpha-Data Trackball (super cool - iluminatet spherical)
5 x Joysticks (one of them selfmade with stuff form Arcade systems -
undamageable)
1 x MSTE - Keyboard
3 x TT - Keyboard

Atari 1040 ST (dma-chip somehow damaged - does not read bootsectors, maybe
easy to fix
Atari Falcon (damaged somehow - maybe I will find the time to look for
the problem)
- SCSI intern + extern adapter
- IDE 2,5 -> 3,5

All (exept Amiga) in a selfmade Tower (about 50cm*45cm*40cm) with drawers
for every board, for Falcon all Ports are layed at the backside,
Westernsockets for Keyboards for each comp., Seperate Power switches,
2 Power-supplies, 5x 5.25 Slots at the frot for Diskdrives,CDRs,,...
2x 5.25 interior for HDDs, ...
All made of Multiplex-Wood-Plates (2cm fat) ;-)
I can sent a photo, if you like

VHB 600 DM (if you like you can also have my 500MB SCSI IBM-DSAS -HDD)

Gruss Joerg

Yes, they dislike the price Intel charge and the power
Microsoft have so they got together to make things better.
It kind of worked ...

The PPc contains a more advanced version of the 030's MMU
which - according to books written at the time (although I
only know this from an OS course at uni and therefore cannot
comment from personal experience) - is quite capable of
marking off a block of memory down to 1K which, tbh, is not
loosing much from the possible max the Tempest board can
handle ...

Also, I was of the impression that this first 8 bytes were
not rom but were in fact setup on boot as part of the
bootstrap by hardware. Without software to protect it I just
get a hole in my OS (magic) instead of a bus error by
accessing address 0x0.

I agree but don't forget that the PPc is the successor to
the 68K family and can happily use the same design as the
original falcon. Also I suspect that this logic is not

needed as the lower 16Mb of the memory etc (including the
'hole' for the os and memory mapped i/o) is passed via the
slower 030 system anyway or there would have to be
adjustments to the DMA system to allow another DMA device to
request access to the main memory pool...

> >The 16 bit bus and eight bit hardware registers may well be a problem,

> PPc was designed for.

Um, the 030 is a 32 bit device - the 24bit addressing is
only because Atari decided at the last min to put an 030
instead of an 020 into the Falcon and a special chip had to
be made up by motorola to fit the socket designed for the
020 ... or at least, that's what I've been told by many
different people.

> >The chip used on the Tempest is only a few months old.

Not quite - it's a PPc 603 - not the new G3 (PPc 750). It's
about 4 years old I think.

> >According to other posts here, Apple's emulator seems to do about
> >four times better than that on a 300MHz 603e...
> >(10-15 times a 32MHz '030)

But we have already mentioned some of the dificaulties -
added to which the Apple system is written into the OS, the
Tempest one won't be ...

>

Don't forget that SDRam has access rates of 10ns... a bit
faster than the 60ns of normal simms :)

>

It is a goal afaik and always has been. It just hasn't been
mentioned in case it turned out not to be viable.

> >>>could lead to a number of much faster programs designed for
> >>>the PPc chip that don't use emmulation.

That is the idea.

> I never said people would dislike it in the TOS market, but only
> that I don't think it will ever be a powerful factor. On Mac and

Most people accepted a long time ago that it would take a
miricle to bring Atari computers back into the 'lime light'.

> >>Native mode might play some role anyway, for superoptimized
> >>NVDI drivers and such things, but hardly for GEM applications.

I'm not so sure. there are already 040 and 060 compiled
versions of programs and really, if the standard 030 code
can be compiled to work in PPc - even without optimisations,
the speed gain by not emmulating would be great - not much
work for a much faster product ...

> I feel the same way, but the other guy did speak of PPc APPs
> replacing 68030 APPs in general, which I deem unrealistic.

I suggest PPc versions of apps - as I said above, it would
not take much if the compilers / assemblers were available.

>
> >>Just developing/porting the tools needed for that would take
> >>years. (Compilers, assemblers, debuggers, etc.)

I'm not so sure - a Macro assembler for the PPc doesn't seem
such a hard task to me - esp with it's RiSC architecture :)

> What good is a raw compiler without the support libs for the
> new machine ?

What new libs would be needed ? In C everything is compiled,
linked then assembled - write a PPc Macro assembler to
assemble the 68K asm to PPc code and u imediatly gain from
having native as apposed to emmulated code :)

>
> A hybrid lib is possible, switching back and forth between
> native and emulation mode (to use gemdos etc), but it would,
> as I said before, be a major development project in itself.
> And it would be a nightmare to debug it !

The PPc does have all the 030 tracing facilities and as long
as u can read both PPc and 68K asm I doubt it would be that
hard :)

The expansion port also supports DMA requests so access to
normal resources will be handled as before but with the PPc
on the spare (one of i think 3 or 4) DMA channels allocated
to the expansion port. Just the PPc would have a higher
priority. Taking into account also that the bus load will be
seriously reduced if the Tempest talks to the Eclipse
graphics system directly and it should all work fine :)

>

> fast as possible, which it then will not be.

The Expansion port holds all this information on it as it
was designed as a processor expansion slot that Atari
themselves were thinking of developing boards for. The 030
is not the bus master anyway, it's just a high priority DMA
device.

Magic is 5 times recursive in every level so it could cope
with the duel processor system.

>

> >do anything with the Tempest memory.

Um, the Tempest memory will simply look like TT Ram if it is
visible to the 030.

> Believe me, trying to let the old and slow processor work safely in
> parallel to the main tempest CPU will cost so much extra ST-RAM access,
> that all the work savings the old processor can provide will not repay
> the losses, and much less gain us anything.

The 030 could happily work as a spooling system etc for the
parallel, serial and networking capabilities as well as
doing dedicated HD Accesss, Floppy access and DSP
communication.

> As the PPc is so much faster than the older stuff, they should not ever
> be allowed to stand between the PPc and immediate system access. That

> with the Falcon, in the sense of having total control over it.

Um, they're just allocated DMA priorities ...

> Sure, but they refer a lot to system calls that do not exist
> for PPc. Those libs are no good without a PPc MiNT kernel.

The extra system calls are only missing at an ASM level and
the whole idea of RiSC is that u use multiple calls to do
what used to take one. The speed increase is due to the
reduced complexity of the cpu - not the better designed asm
codes. In 68K it will take say one call to do a bcd add, in
RiSC it may take three but the speed increase of the RiSC
chip is say 7 x so u gain overall. A Macro Assembler can
convert the asm codes of the 68K into the multiple codes of
the PPc ...

>

> >
> >The busses are indeed 32 bit but, IIRC, only the actual processor
> >on the TT is 32 MHz. The rest of the system is 16 MHz.

Correct.

>
> So what ?
> It is the CPU which performs the bus accesses and executes opcodes.
> As long as that is done at 32 MHz I call it a 32 MHz computer.

I think a much better judge is the system speed. eg,
increasing the bus speed on a falcon from 16 to 25 has a
much higher effect than increasing the cpu to 25mhz. In a PC
(sorry, only a quick example... <g>) having a cpu speed of
400MHz is useless with a 33Mhz system bus - it's the system
bus that makes the difference.

> That is the main design weakness of a standard Falcon, that
> VIDEL blocks the CPU not only from updating screen, but also
> from accessing anything else in ST-RAM when VIDEL is doing an
> access burst, and in high resolutions that happens *often*.

That is the DMA design of the Falcon and one of it's best features for me is its DMA / UMA architecture - it simplifies things so much. At 1024*768 with Nemisis mys system still runs faster than 640*480 without ...

The real point after all this is that the PPc is faster even under emmulation than an 030. - good point

It may be possible to reliably do multiprocessing - if we can't so what

Developing PPc specific code is hard, compiling old code to not use emmulation is easy and will give speed increase - good point

Tempest gives us serious ammounts of very fast TT compatable Ram - good point

As we seem to be spending most of the time arguing over the minor points of the Tempest board i assume everyone is for it overall :)

I've never been very involved in this but as I understood it the original
idea was that Mac and IBM PowerPC should become mutually compatible, so
any software could be moved freely between them. That part of the concept
was apparently dropped later, all according to friends more interested in
these activities than I was. So Apple's contribution had nothing to do
with the processor architecture, it was more a case of IBM and Apple trying
to join forces against the common enemy, M$.

Ironic in a way, that M$ gained their current position only because IBM
gave them a totally undeserved near-monopoly on DOS production for so many
years, and now they are mortal enemies.

>>Yes, I agree, but no emulator of this kind has been made yet, so it is very

Impressive, but I doubt that they are going to giftwrap it and hand it
over to Core. And the efficiency of one emulator implementation is not
necessarily related to that of another. That can vary greatly.

>>That would not in itself give a fair estimate of speed in a Falcon, since

But a Falcon has so many peculiarities that are totally missing in a Mac,
and we still have not seen the finished product or the emulator that it
will use. We have no guarantees that it will match the one for Mac.

>>It'll be interesting to see some NemBench files for the Tempest when it is

>
>Nembench results for Apple's emulator on a similar processor have been
>posted here.

So they have, but I still say that they only show what is possible, not
the speed that the Tempest is necessarily going to have. It might come
close, or it might not. There is no way to know that yet.

>with Atari defined. Interesting ...

Lets not get silly here, I never said any such thing. :-)

I said I "had a feeling" that the opinions might have little to with what
Atari defined, and that was partly because precise doc references were
not given. "Having a feeling" about something unknown is not the same
thing as "Considering" something about a known document.

Evidently my "feeling" was wrong this time. No big deal.

>The docs clearly state that the enhanced shel_write() parameter block
>may contain a "Psetlimit() value" (1). I guess I'm not wrong to assume
>this means the value given there is directly passed to Psetlimit(),

>fails here.

This is absolutely correct. I seldom bother to use MiNT specific calls
myself, as I prefer to use coding that works consistently regardless
of whether MiNT or MagiC (or whatever) is used, and that is why I have
somehow missed this info before. But I can see that you need to use it
in this case, as memory limited APP launching can be important under
multitasking systems.

>The next version of Thing will have a workaround, i.e. it won't set the
>"enable Psetlimit()"-bit in the call to shel_write() when the limit is
>zero. This wouldn't have been necessary if Geneva without MiNT would get
>it right.

Even so, it is what I consider a more logical way to do it. Why use a
special mode if the user has not requested one for that application ?

Btw:
Why is it that the default entry can not be given a memory limit ?

(I mean the one with the DFLT line in THING.INF)

That would be really useful, to protect RAM when testing programs with
unknown behaviour. In order to do this now one must always 'install'
them first, to set a limit for each particular program.

>Note that I simply forgot about this issue, that's why I said Thing
>would work flawlessly with Geneva.

I had guessed as much already, and I had a hunch you would write a
followup when you saw our posts about the patching.

>But it's a bug in Geneva, not a problem of not using "special shel_write()
>parameters necessary for Geneva".

That was merely a guess about the reason for this particular problem,
based on experiences I have had with the shel_write modes of Geneva
earlier. They may be compatible in Geneva 6, I'm not entirely sure
about that yet, but they most certainly were not in older versions.

>(1) The docs don't state which of the three possible Psetlimit() modes
> this refers to, but it's at least quite sure it does not mean the
> CPU limit, but one of the two memory limits, as otherwise the
> desktop found in AES 4.1 wouldn't have the option to limit the
> memory for installed applications.

It must be the Malloc limit, at least as Geneva implements it, as the
applications could load and start with a limit of 0.

I have tested it in MagiC too, and it also allows (for example) a 6KB
program to run with a limit of 2KB, so that too implies a Malloc limit.

Finally, I steeled myself for the most dreadful task of all, and did it.
Yes, I did it, and survived to tell about it. I booted MTOS...!!!
(Looking out of my window I then noticed that a herd of pigs flew by :-)

I even managed to keep it alive long enough to make a similar test as
for Geneva and MagiC above. MTOS too implements the Malloc memory limit.

Having tested that I quickly pressed reset to get out of that horrible
environment, and get back into a decent boot setup again. :-)

I'm only partly joking above. MTOS really is a horrible mess.
The only good things about it is that it inspired others into making
more functional implementations, such as Geneva and NAES, and that it
forced Atari to release some specs on how such things should work.
It's just a pity that they never properly debugged their own MTOS.

Hi!

In article <3753d3eedbb781@oden.se>,
dlanor@oden.se (Ronald Andersson) writes:
> Even so, it is what I consider a more logical way to do it. Why use a
> special mode if the user has not requested one for that application ?

Because it save a special if-statement. Thing's internal representation
for "no limit" is a zero, and that's excactly what shel_write() expects
for this. So without this Geneva-workaround, I could just write the
internal limit value to the shel_write() parameter block.

> Why is it that the default entry can not be given a memory limit ?
> (I mean the one with the DFLT line in THING.INF)

I can't recall right now, it maybe had a reason. If not, I'll change
this for the next version.

> In order to do this now one must always 'install' them first, to set a
> limit for each particular program.

Or use MiNT with a suitable MAXMEM-line in mint.cnf ;)

> They may be compatible in Geneva 6, I'm not entirely sure about that
> yet, but they most certainly were not in older versions.

Well, launching GEM apps was never a problem in Geneva, only TOS
programs caused problems when you wanted to decide yourself whether it's
a TOS program or not - only auto-detection worked. This was fixed for
006 after submitting a problem report.

> It must be the Malloc limit, at least as Geneva implements it, as the
> applications could load and start with a limit of 0.

Yes, that's what common implementations use, including MultiTOS. But
from the docs alone, you can't judge that, unfortunately.

> I'm only partly joking above. MTOS really is a horrible mess.

At least AES 4.0. 4.1 (which was never officially released) is a lot
more useable, but also introduced new bugs ...

Ciao

Thomas

AFAIK, you normally get a bus error if no device 'replies' to an access.

>For significant acceleration it also becomes necessary to bypass
>much of the Falcon's original decoding, and the signals for that

For significant acceleration of accesses to the normal Falcon bus.
Everything else is independent of that decoding, naturally.

>must also be generated by extra logic. It is not realistic to
>say that the PPc just has to be connected to the Falcon bus with
>no adaptive logic. That would not give satisfactory results.

It would not be as good as the CTII, but I don't think any other
accelerator cards do much about this. On the AB040, accesses on the
Falcon bus are significantly slower than using the original '030.

>That, yes, plus the fact that many hardware registers are based on
>triplets of bytes to form 24 bit addresses etc. These are not normal

No, but as long as it's possible to do byte accesses at all, there
is no real problem.

>Recently designed chips are usually quite expensive at first.

Well, microcontrollers usually aren't all that expensive, anyway.

Well, someone posted complete Nembench results and those include cached
and linear memory accesses.

With 16+16kbyte cache, you shouldn't have to worry all that much about
cache misses, anyway (depending on what you're doing, of course).

Theoretically (assuming single cycles access times), a 100 MHz SDRAM
can deliver 800 Mbyte/s, which should be plenty...
(I'm not saying that a 603e can get that kind of speed. It obviously
won't get anywhere near under 68k emulation.)

Again, a simple thing to do (implementing it in the first case, that is,
not the patching), which I'd dare to guarantee will be possible.

>What good is a raw compiler without the support libs for the
>new machine ?

Just about every single library I've seen for the Atari has been
completely (or almost so) C code, so what's the problem?

>It can be used for developing optimized drivers and the like,
>as I assumed earlier, but no major applications. And it is
>not just a question of writing new libs, as a PPC APP would
>also need PPc compatible system routines, which don't exist.

There would be no problem calling the standard TOS routines, as
long as there is a way to switch over from PPC mode to emulation.

>A hybrid lib is possible, switching back and forth between
>native and emulation mode (to use gemdos etc), but it would,
>as I said before, be a major development project in itself.

Why?
Pushing arguments on a stack can be done by the PPC and then it's
just a matter of telling the emulator where to fetch its register
values and run until RTE.

>And it would be a nightmare to debug it !

If the emulator itself works, there is very little more that needs
to be done. I'm not saying that it will be an easy job to get the
emulator 100% correct, though.

>>If the bus is not available, another chip that wants access will

>Agreed, but what can it do then ? The running software has reached a
>point where access on the Falcon bus is needed, so what _good_ does it

If the chip really needs access to the Falcon bus, there's of course
nothing that can be done. The point is that you can go for a long time
without needing that.

>then do that the tempest can access internally. It can't even service
>any system interrupts, as those arise on the Falcon bus and will be

Problems like that may indeed be difficult to handle.
I wouldn't really bet on the dual processor thing being very useful
even if it works.

>>So, don't allow both to do system calls at once.

Well, the normal TOS has no concept of more than one running program,
so that's of course not possible.

>changed. MagiC and MiNT have managed to get around the singletasking
>limitation, but they are still not capable of multiCPU usage.

The actual calls shouldn't be much of a problem (just use some kind of
read/modify/write lock), but the process scheduling is of course another
matter.

>>>3: It would also lead to partly parallel address spaces, making
>>> all pointers from ST-RAM to FastRAM ambiguous.
...
>He was not speaking of the old 68030, but of the CPU on other
>accelerators, that have FastRAM. That is why I replied as I did.

Ah!

>Perhaps you missed the point where he claimed that old accelerators
>could be kept in the system after installing tempest ?

Yes, I did.

Well, it obviously would be a problem if the addresses actually
overlapped, but you can avoid that if it is detected on startup that
there are two accelerator boards. The old board would probably have
to use the standard memory areas, but the Tempest could put itself
elsewhere.
It's not likely that they'll be able to access the memory on the other
board in any case.

>>It's very easy to think of parallel processing jobs that don't

Give it a job to do in some way, for example by placing some kind of
command in a given memory location that gets checked from time to time.
Not overly efficient, but it would work.

>Believe me, trying to let the old and slow processor work safely in
>parallel to the main tempest CPU will cost so much extra ST-RAM access,
>that all the work savings the old processor can provide will not repay
>the losses, and much less gain us anything.

No, the original processor would be rather useless, that's true.
Something like an AB040 or CTII on the other hand might be nice to have.

I wouldn't consider worrying about this a high priority if I was working
on the accelerator board, though.

>I was not talking of extra hardware here. The mere fact that another
>CPU also runs as alternative bus master creates an effective bottleneck.

Agreed, but only for accesses over that bus.

>>The MiNT libs etc are mostly C code.
>
>Sure, but they refer a lot to system calls that do not exist
>for PPc. Those libs are no good without a PPc MiNT kernel.

If you run the system calls under emulation that isn't a problem.

A PPC MiNT kernel (not to mention VDI and AES) would definitely be a
good idea in any case. Fortunately, there isn't all that much assembly
in MiNT, so it should be doable.

>As long as that is done at 32 MHz I call it a 32 MHz computer.

Yes. I just wanted to point out that the the double width of the busses
and the double clock speed don't make the TT four times as fast.
For memory bound things, I guess it might in some cases, though.

>That is the main design weakness of a standard Falcon, that
>VIDEL blocks the CPU not only from updating screen, but also
>from accessing anything else in ST-RAM when VIDEL is doing an
>access burst, and in high resolutions that happens *often*.

Well, there is only one ST-RAM so it obviously can't be accessed by
two devices at once. I certainly would have liked to have some kind
of FastRAM, though (I do now of course with my AB040).

>My main point, which you seem to agree on, was that we can't

Yes.

It's not a PPC 603, but an MPC8240.
The press release about that chip is from October '98.

But this was running Atari software on that Mac, so only the emulator
itself is used.

>Don't forget that SDRam has access rates of 10ns... a bit
>faster than the 60ns of normal simms :)

That's not the way it works, unfortunately.
(The 10ns is the time between successive reads once the first access
has been done.)

>Most people accepted a long time ago that it would take a
>miricle to bring Atari computers back into the 'lime light'.

Not even a miracle could do that, I'm afraid.

>I suggest PPc versions of apps - as I said above, it would
>not take much if the compilers / assemblers were available.

Perhaps not, but for commercial companies it would mean another version
to support, for a (probably) very small market.

>I'm not so sure - a Macro assembler for the PPc doesn't seem
>such a hard task to me - esp with it's RiSC architecture :)

You don't have to write your own.
GCC has been ported to the PPC and that obviously has an assembler.

>What new libs would be needed ? In C everything is compiled,
>linked then assembled - write a PPc Macro assembler to
>assemble the 68K asm to PPc code and u imediatly gain from
>having native as apposed to emmulated code :)

That is not something that is very simple to do, unfortunately.

> finished product tells us.

For what it's worth, Norton Utilities has a benchmarking program that tests "emulated 68020" performance. According to the 11 CPU-only tests, overall a 300MHz 603e is 13X faster than a 25MHz 68030-based Macintosh IIci. This number pretty much coincides with my results of testing GrafTool and other applications under MagiCMac.

At least this and the other tests creates a "ball park" figure of what to expect from the Titan board (perhaps 20X faster than a stock Falcon?). Like you say, though, we'll have to wait and see.

Erm, I meant to say Tempest, not Titan.

Tired of ASH's PPP-Iconnect, I have decided to try elsewhere in the world of inet connectiong software. After downloading sting, de-archiving it and placing what I found in the appropriate folders, everytime I boot up, IT tells me it cannot find DEFAULT.CFG. Interestingly enough, neither can I. It doesn't seem tol be found anywhere in the archive.

Can anyone tell me where I can find/create it? Where do I put default once I have found it?

That's true. Most Mac-users I know has replaced the original 68k emulator
with a 3rd party replacement which they claim is twice as fast.

You know that when MMU is used, you obtain more heat ???!!!
I can't see other differences between TOS 4.0x and 7.0x !

>----- snip ----- re: my CT2B problems in TOS 7.x mode
>>
>>What is symptoms ?
>
>Spontaneous freezing and/or bombing, with no apparent 'provocation'.

I have only seen a problem Saturday with 25 degrees in my room, a freezing
(mouse cursor disapears) during an transfert with CAB on-line (an archive).
So I have removed CPU cooler, and installed an industrial fan at vertical
right of 68030 (on 25.175 oscillator). I use always FALCON's box, I have
measured 38 degrees on power-supply before modification with 22 degrees in
my room and now I obtain with same temperature :
- Outside cartrige-port : 26 degrees.
- On power-supply : 32 degrees.
- On the groove above F4-F5 keys : 24 degrees
- On floppy disk : 21 degrees
I think it's better to cool all CT2 than only 68030 (I think to Lattices...).

>exceed 500 mV, and that is well out of any 'risky' regions.

Mabye a little voltage exist between ground of CT2 (FPU) and ground of U44.
Now I think than better solution is your LS38.

>>Aniplayer use only this interrupt in 65K colors (or screen 320 x 240 without GEM)

I you movie is <= 320 x 240, it's sure that hicolor is used. You can see dithering
in 256 colors.

>----- some tests later -----
>
>Yes, Aniplayer does work when booted in hicolour mode and viewing MPEGs
>with my hardware DSP patch active, and DSP_IRQ removed.

It's a bad example, I use only DSP interrupt for files AVI/MOV with codecs
Cinepak (cvid), Apple Video (rpza), Micro$soft Video 1 (cram8) for better
transferts from/to host port.

With MPEG and JPEG, DSP interrupt isn't used.

>----- anip ----- re: On the need for the INTERDSP patch and DSP_IRQ drawbacks

Hi Dave, I had the same problem when I used STinG. The default.cfg should be located in the STinG directory on your ST. There should also be a .inf file (or .cgf perhaps) in the AUTO folder. Open up the file and make sure that the drive extension (A:, B:, etc) is correct.

I hope that helps.

Matt.

Hey, first thing I would like to say is "ThankYoU!" to all the wonderful replies and emails that people have been sending regarding this subject. This newsgroup is terriffic for newcomers such as myself that are willing to take up the console (as it were <smile>) and support the Atari platform!

A quick follow-up question: I am still in the search for a monitor so that I can use my Falcon, but it seems from the letters that I have been getting that I would be better served to obtain an adapter *first* and then a monitor to suit it? Does anyone know where I can obtain such adapters? At this point I would really just like to get the unit up and running so that I can start making some music :)
If any of you could point me in the right direction here, I would appreciate it!

Thanks!

-Steve

Source record: 77820

Hi, Can anyone please tell me where I can get the Atari version of the transfer-coding prog base64. This is being used by Windows progs to send msgs which can be automatically decoded by the appropriate MSoft Windows prgs. I can decode UUencoded msgs quite happily when received from said MSoft sources, but base64 beats me at present. The irony is that some of the MSoft using people don't know which code they are using when they send out these msgs, but I receive them in code form which reveals the name of the code!
With many thanks in anticipation. Cheers, Nigel Williamson.

I was checking out the "Jane Jetson" strip poker game for the ST and as I said before, it's really just the old "Teen Queen" strip poker game for the ST with the graphics encryption busted to let it use ordinary Degas .PC1 files.

Trying different pallets on the .PC1 files I've discovered that there's not a lot of room for changing the pallets without having a bad effect on the game's graphics. The only colour that can be changed without altering any of the game's sprite graphics is the background colour. Any other colour can only be changed a little bit or the sprites won't look right.

The sprite data for this game is saved as .SPR files. Does anyone know of a sprite editor for the ST that might work with these files? If we could simplify the sprites then the only fixed colours in the game would be white, black, and red (which I'm sure most image files would use anyways).

All we'd have to do is remove the player's hands graphics (which would free up half the pallet right there) then simplify the cards so they only use the colours, black, white and red, and then simplify the dialogue box and game buttons so they only use black, white, and red.

In anycase, I've created my first Hentai strip poker disk from various images scrounged off the net (most from KiSS Dolls). I'll have it up on my webpage for about a week or so at this URL. If anyone wants to archive it on another site feel free to do so. Maybe someone will put together a webpage dedicated to Atari ST Hentai programs with a special section for Strip Poker disks.

The file I've got includes the data disk and the program disk all on one. I'm not sure but I think that the only things the data disk needs is the .PC1 files and the SOUNDS.ECH file.

The SOUNDS.ECH file is just an 8-bit mono, 7333KHz signed sample. I don't know how the program itself employes this sound file. It might just take a set number of bytes for each of the sounds in which case creating new SOUNDS.ECH files will be difficult because all the sounds you use will have to fit in the same amount of space that the original uses. Or it might look for a certain length of silence between the samples to set up the sounds (this would be great because then we wouldn't be restricted in the length of our samples apart from disk and memory limitations).

Anyways, here's the URL for the "Sailor Mercury" Strip Poker game for the Atari ST.

http://www.hwcn.org/~ad329/acsp.zip

Now we can show all those, PC, Mac, and Amiga users that we ST users can be just as hentai as they are! ;)

>Hi, Can anyone please tell me where I can get the Atari version of the
>transfer-coding prog base64.

I see you are using Oasis2 Nigel. Oasis2 can handle Base64/MIME
encoded messages (news and email) but it probably isn't very good.
I use aMail as my emailer and it handles MIME messages fine.

Alternatively you could pick-up one of the several decoder packers
such as MUNPACK or ESSCode.

Try something like:

http://launchpad2.atari.org/atari_software.html

or the ever useful:

http://www.altavista.com

Rich.

That's the relationship between the companies, but I was asking
about the relation ship between 680x0 CPUs and PPc.

----- snip ----- re: physical address 0..7 goes to writeprotected ROM

The 030 PMMU can handle page sizes down to 256 bytes.
But I was talking about an area of 8 bytes above. I doubt
very much that it would be a good idea to handle that through
any MMU. It should be done by decoding hardware.

>Also, I was of the impression that this first 8 bytes were
>not rom but were in fact setup on boot as part of the

That is entirely wrong.
On all Atari TOS machines that area is physically identical
with the 8 first bytes of the ROM, and that is handled by the
decoding hardware. No software is involved.

It is possible for a boot program to do what you describe, after
it has for some reason remapped logical address zero to some other
physical address, but normal TOS never does that. If I write
to any of the first 8 bytes they remain unchanged, and before I
installed my CT2B, I would also get a bus error as result of the
attempt. Unfortunately the CT2B does not generate this signal
like it should.

>request access to the main memory pool...

I don't have any idea what you are talking about above.
What DMA device ? The CPU does access RAM via VIDEL and
COMBEL, but it does *not* do so as a DMA operation.

Such an operation as 'requesting access to the memory pool'
simply does not exist. It is a matter of bus arbitration
between various alternative bus masters. One of these bus
masters is the DMA controller, but it is not involved in
any accesses made by the CPU.

----- snip ----- re: Falcon 24 bit address bus and 24 bit DMA address regs

>be made up by motorola to fit the socket designed for the
>020 ... or at least, that's what I've been told by many
>different people.

Those people have then told you nonsense.

There isn't even a CPU socket on my Falcon, and the chip type is not
one for which any sockets exist.

The CPU is a surface-mounted type soldered directly to the motherboard,
and the top 8 address bits of it are simply not connected anywhere else.
The only reason why it was done so was to save some hardware. COMBEL
would need to be slightly more complex to handle 8 more address lines,
and they would also have required more board space for signal routing,
and Atari didn't care how skipping this would limit the machine.

These decisions were _not_ made in the 'last min', because the internal
registers of both COMBEL and VIDEL are based on this limitation.
Any story anout a 68020 is probably a rumour 'planted' by Atari to
hide the real reasons.

I don't think for a moment that Motorola would make a special design
just for Atari. They probably just sorted through nornal 68030 chips
that had been rejected and looked for those with testable damage only

to the upper 8 address bits and then they invented a new name for such
rejects.

We know from the past that Atari never had any compunctions about
using partial rejects in their equipment. The most famous incident
is when they put faulty DMA chips in an STe series, knowing that none
of them could handle harddisks. They assumed most users would only
have floppy drives, so they didn't care.

For the speeds he mentioned I would definitely expect waitstates to be
needed. A 32 MHz 68030 needs to insert plenty wait states for normal
SIMMs, so anything 15 times faster would need waitstates for SDRAM too.

>> ----- snip ----- re: running native PPc code

I don't understand what you mean here.
What does "Compile the standard 030 code to work in the PPc" mean ?
If it is 030 code, then it is already compiled, and can never work
directly in the PPc.

Possibly you mean that the sources of current 030 programs could
be recompiled for PPc, thus producing corresponding PPc code.
That is possible, but not easy, as no support libraries exist
for the PPc.

The case is not comparable to 040 or 060, because they are both
object code compatible with 030, except for a very small number
of opcodes (which nevertheless do cause some problems).

>> I feel the same way, but the other guy did speak of PPc APPs

>What new libs would be needed ? In C everything is compiled,
>linked then assembled - write a PPc Macro assembler to
>assemble the 68K asm to PPc code and u imediatly gain from
>having native as apposed to emmulated code :)

C compilation converts human-written C source to linkable objects.
Assembly converts human-written asm source to linkable objects
Linking combines linkable objects into executable programs.
What you said does not fit in this process.

For most projects we would need both a C compiler transforming
standard C source to linkable object modules holdingPPc code,
And an assembler capable of producing such modules from 68K
assebly source. These could then be linked into a pseudo-
executable file.

Producing those new tools would be a huge project.

It is possible, but totally unnecessary (and no longer normal)
for a compiler to produce asm source instead of object code,
but even then it is to be assebled into linkable objects
before those can be linked into an executable program.
So what you said doesnt fit this older model either.

You seem to confuse assembly with linking, and also confuse
object modules with assembly sources.

>> A hybrid lib is possible, switching back and forth between
>> native and emulation mode (to use gemdos etc), but it would,

>> And it would be a nightmare to debug it !
>
>The PPc does have all the 030 tracing facilities and as long
>as u can read both PPc and 68K asm I doubt it would be that
>hard :)

So what if the PPc has trace facilities? There is no debugger
that supports it. If the PPc is in native mode when it crashes
or reaches a breakpoint, then it will still be in native mode
when it should be executed in the debugger, which is 030 code,
and then the system as a whole will crash.

Assuming we have managed to recompile a debugger into PPc
code it still does not help. Because it will still perform
the same operations as before, which means that it will
manipulate the PPc code as if it were 030 code, and further,
the debugger will still be PPc code when a breakpoint or
crash occurs with PPc in emulator mode, and then the system
will crash again, for the opposite reason as above.

To debug something like this a debugger is needed that can
understand both code types, and which also contains code
of both types. No such debugger exists for any TOS machine,
and developing one would be a *very* demanding project.
(Worthwhile, to be sure, but extremely demanding.)

>> ----- snip ----- re: running PPc parallel with 68030

What are you talking about ? The Falcon does *not* have *any*
spare DMA channels allocated to the expansion port. There are
no DMA handshaking lines on that port. Aren't you thinking
about the DSP port here. It does have DMA capabilities. In
any case, they are not in any way involved with CPU accesses
either by original CPU or a replacement on the expansion port.

You are possibly thinking of some DMA channels on the tempest
itself, but that is no help at all with the problems I spoke of.

>> Agreed, but what can it do then ? The running software has reached a

>
>The Expansion port holds all this information on it as it
>was designed as a processor expansion slot that Atari
>themselves were thinking of developing boards for.

That has nothing to do with what I said. When an interrupt comes in and
the original CPU is running, then that CPU responds to the interrupt.

>The 030 is not the bus master anyway, it's just a high priority DMA
>device.

That is simply not true. DMA devices make their accesses via the
DMA chip (U36) which takes over as a temporary bus master and places
the contents of the relevant DMA address register on the address
bus to tell COMBEL which RAM address is to be accessed via VIDEL.
That DMA chip is not involved at all with the CPU accesses.

The CPU independently drives the address bus with whatever addresses
current processing demands, and uses these not only to access ST-RAM,
but also to access all other system resources. This is something that
no DMA device can do. The only thing they have in common is that all
have to access ST-RAM via COMBEL and VIDEL, as there is no other way.

Bus masters do have a priority scheme, but in this scheme the CPU has
the lowest priority, so it is always the CPU that has to wait when
the others want the bus. That is of course necessary to allow DMA
operations to function for fast operations like SCSI transfers.

----- snip ----- re: more on multiprocessor use
>
>Magic is 5 times recursive in every level so it could cope
>with the duel processor system.

No, that is not the case.

First, you mean reentrant, not recursive. Second, reentrancy
is a big help in coping with multitasking, and is also required
to handle multiprocessor use, but it is not enough to make that
work. That would require the taskswitcher to be fully aware
of both CPU's, so that CPU switching and task switching can
be synchronized. It would also require rewriting large parts
of BIOS, XBIOS, and GEMDOS.

Making a real multi_processor system is a lot more difficult,
than you seem to realize. Simple schemes like this one are
doomed to fail, and would not be efficient anyway, as the
old CPU can not add any significant percentage of power to
the PPc driven system, and will steal such power by its
activity.

Say that 030 runs the bus for 10 ms, during which it delays
various PPc accesses to the Falcon for an accumulated 2 ms,
And is itself delayed by the PPc for a total of 2 ms.

This means we have gained 8 ms of 030 work at cost of 2 ms
of PPc work, which is an acceoptable deal only if the PPc
emulator is less than four times faster than the 030.

To this you must also add the fact that much of the lost
PPc time would have been spent in the SDRAM, whereas the
gained CPU time can only be spent in ST-RAM or ROM.

>> Believe me, trying to let the old and slow processor work safely in
>> parallel to the main tempest CPU will cost so much extra ST-RAM access,
>> that all the work savings the old processor can provide will not repay
>> the losses, and much less gain us anything.
>
>The 030 could happily work as a spooling system etc for the
>parallel, serial and networking capabilities as well as
>doing dedicated HD Accesss, Floppy access and DSP
>communication.

'Happily' ? Perhaps it would be happy, but the user would not.
By not using the 030, access time on the Falcon bus would be
freed for the PPc, and the PPc can do much more useful work in
such freed time than the 030 could possibly do.

>> As the PPc is so much faster than the older stuff, they should not ever
>> be allowed to stand between the PPc and immediate system access. That
>> is why I say they should be skipped, to allow the PPc to be 'integrated'
>> with the Falcon, in the sense of having total control over it.
>
>Um, they're just allocated DMA priorities ...

No they are not, because it does not work that way.
My CT2B is *not* a DMA port, it is a true bus master.
The same goes for original 030 on a standard Falcon.

I don't know where you got the info about this supposed
DMA implementation, but it does not exist on the Falcon.

The only way to prevent the internal CPU from being the
bus master is to use the bus arbitration signals to make
some other chip the bus master.

>> Sure, but they refer a lot to system calls that do not exist
>> for PPc. Those libs are no good without a PPc MiNT kernel.
>
>The extra system calls are only missing at an ASM level and
>the whole idea of RiSC is that u use multiple calls to do
>what used to take one. The speed increase is due to the

>RiSC it may take three but the speed increase of the RiSC

>chip is say 7 x so u gain overall. A Macro Assembler can
>convert the asm codes of the 68K into the multiple codes of
>the PPc ...

I already know the basics of what a RISC processor is,
but you miss some of the the basics of TOS programming.

I said that such PPc code needs a MiNT kernel, and yes, such
a kernel can be produced. But if MiNT is to be used, then
the 68030 code also needs a 68030 kernel, and it is not
possible to install two cooperative MiNT kernels.

The same naturally goes for any other global system functions.

The only functional method is to make wrapper functions
that switch between PPc and emulator mode whenever the PPc
code needs to call any system routines. That will work but
each such call will then be slower than if the PPc had run
in emulator mode constantly.

Such wrappers may also be put on entry/exit points of system
functions written specially to replace old ones, and using
PPc code internally.

Eg: Here is a generic context-switch wrapper solution:

case 0: APP in emulator mode calls old system function
This is the standard case, so PPc just remains in emulator
mode throughout the function call and thereafter as well.

case 1: APP in emulator mode calls new system function.
APP stays in emulator mode and calls the system function. An
entry wrapper switches to native mode. The function executes
in native mode and then passes an exit wrapper, switching to
emulator mode, and then returns to the caller in emulator mode.

case 2: APP in native mode calls old system function.
APP calls a call wrapper which switches to emulator mode and
calls the system function. It performs the function in emulator
mode and then returns to the call wrapper which switches PPc
to native mode and returns to the original caller in native mode.

case 3: APP in native mode calls new system function.
APP calls a call wrapper which switches to emulator mode and
calls the system function. An entry wrapper switches to native
mode. The function executes in native mode and then passes an
exit wrapper, switching to emulator mode, and then returns to
the call wrapper which switches PPc to native mode and returns
to the original caller in native mode.

It should be obvious from the above that these wrappers ensure
that it is only within a local scope that the PPc stays in the
native mode. For all transitions between unrelated code parts
a switch is made to emulator mode. This ensures compatibility

between all old and new parts.

Two more kinds of wrapper needs to be defined though, to gain
compatibility with Pexec. This must naturally launch programs
in emulator mode, so a startup wrapper must be used for native
APPs, and then when the program is to terminate, that must be
done through a termination wrapper switching back to emulator
mode.

That solves the problem of calling, and gradually improving,
system functions. The problem of finding good PPc development
tools to use on a Falcon remains, however.

>> So what ?
>> It is the CPU which performs the bus accesses and executes opcodes.
>> As long as that is done at 32 MHz I call it a 32 MHz computer.
>
>I think a much better judge is the system speed. eg,
>increasing the bus speed on a falcon from 16 to 25 has a
>much higher effect than increasing the cpu to 25mhz.

This so-called bus speed on the Falcon iw widely misunderstood.
The large speedup occurs because the CPU doesn't have any direct
access to ST-RAM, so that access to this RAM has to go through
COMBEL (RAM address) and VIDEL (RAM data). Changing the clock
speed of those circuits is what you call changing the bus speed.

For access to resources that the CPU can address directly, such
as TT-RAM, it is the CPU clock that determines the bus speed,
although this is naturally affected by the DRAM controller on
the TT-RAM card which normally needs to insert some waitstates.

It is much the same on an expanded Falcon with FastRAM. On my
CT2B access to ST-RAM is on a 25 MHz 16bit bus. Access to the
other parts of the falcon is on a 50 MHz 16bit bus, while the
FastRAM is accessed on a 32bit 50 MHz bus.

>In a PC (sorry, only a quick example... <g>) having a cpu speed of
>400MHz is useless with a 33Mhz system bus - it's the system
>bus that makes the difference.

The terminology here is completely unrelated. The cpu you talk
about is designed for separate control of bus speed and CPU
speed, which a 68030 is not.

On a 68030 the CLK signal input sets both the CPU speed and
the bus speed. It is only when access to some resource,
such as ST-RAM, is made through the mediation of some other
chip that this chip sets the bus speed for access to that
resource. What you have done then is to split the system
into one bus controlled by that extra chip, and the real
CPU bus controlled by the 68030.

>> That is the main design weakness of a standard Falcon, that
>> VIDEL blocks the CPU not only from updating screen, but also
>> from accessing anything else in ST-RAM when VIDEL is doing an
>> access burst, and in high resolutions that happens *often*.
>
>That is the DMA design of the Falcon and one of it's best
>features for me is its DMA / UMA architecture - it

My Falcon service manuals say nothing about UMA. What is it ?

>simplifies things so much. At 1024*768 with Nemisis mys
>system still runs faster than 640*480 without ...

All you are saying is that COMBEL+VIDEL work faster if clocked
faster. Sure. What has that to do with DMA ?

>The real point after all this is that the PPc is faster even
>under emmulation than an 030. - good point

Of course it is faster. That is the whole point of the
Tempest to begin with, and the reason not to handicap that
speed by insisting on keeping the old CPU active.

>It may be possible to reliably do multiprocessing - if we
>can't so what

I agree with the latter :-)

>Developing PPc specific code is hard, compiling old code to
>not use emmulation is easy and will give speed increase -
>good point
>
>Tempest gives us serious ammounts of very fast TT compatable
>Ram - good point
>
>As we seem to be spending most of the time arguing over the
>minor points of the Tempest board i assume everyone is for
>it overall :)

Of course. I think everyone here favours all continued
support for our platform. But that does not mean I'll buy
any until I have some idea of what problems it may have.
Most new designs have 'childhood diseases', and I'd rather
not get involved in such again for a while.

Hello,

Can a TT keyboard be used on a Mega Ste. Also is it possible to repair a dead key on an Mega Ste keyboard and if so what do you look for, take apart and replace?

Thanks

Alyre Chiasson

34. Atari/iMac disk conversion

Newsgroup: comp.sys.atari.st

Source record: 77828

Hi! I am a longtime Atari user, and I recently purchased an iMac... I have the SuperDisk drive, which reads regular Mac floppies...

I have been trying to use "Dust" (a shareware Atari disk converter) to read my Atari floppies on the iMac and convert them into .ST files that I could use with Nostalgia or some other emulator. Unfortunately, this doesn't seem to be working. I think it's just because Dust is so old it doesn't recognize the USB floppy drive.

In any case, can someone suggest a program that I might be able to use to read and/or convert these Atari disks on my iMac?

thanks in advance!

--Josh

>not feel any significant speed difference.

This is typical of text editors and other highly user-interactive APPs like
OKami. So much of the work is limited in speed by human interactions, and
we are so slow that this hides computer speed limitations most of the time,
making them unsuitable for use in system speed comparisons.

>But I just tried a program
>that does a lot of calculations and window draws in the main evnt_multi-
>loop with evnt_timer active and set to zero. The same calculations took
>almost exactly twice as much time to complete with Mint running.

That is to be expected, and is mainly due to the fact that MiNT has much
more 'expensive' overhead costs in the GEMDOS interface.

>My computers only have 4 MB each and with 2 MB left for "user programs"
>when Geneva, NVDI, Neodesk, STinG, etc. are running. This mostly works
>good enough for my needs.

That's what I meant. Using MiNT+MintNet or MagiC would not leave you as
much RAM available, and you might not manage to run all the APPs that you
want to, and usually can do with Geneva.

>By using more than one computer I also get true multitasking :-) Been
>experimenting with Bnet and it seems to work even without Magic. There
>where some bombs when under heavy load but I have not isolated what
>caused them.

Vassili is still working on BNet, so if you do identify some specific
error conditions, be sure to report them to him.

>>But the usefulness of all this is lowered drastically if one can't also
>>use the same desktop as usual, which for me means Thing.
>
>I am still using Neodesk as it does what I want in a very stable way.

Desktop choice is very much a matter of taste, so it's not really a
debatable subject. My own choice of Thing is mainly motivated by the
need to use a consistent desktop in wildly different system setups.

Thing and Gemini are the only ones that have managed to do this well,
so Thing is the only sensible choice for me, as Gemini is no longer
supported.

>And, I do run Win-95 (on original install since -96!) too, so maybe
>that's the reason I still find Neodesk to be a very usable desktop.

From what I've heard that sounds rather likely. Fortunately I am not
a Window$ victim myself, but I've heard lots from those who are.

Btw:
I really think it is more realistic to call M$ customers 'victims',
rather than just 'users'. It is so much more descriptive of the real
relationships. This leads to some interesting conclusions on what to
call M$ themselves...

Well, I was sure I had mentioned it in the PMMU disussion too, but
bever mind that now. The important thing is that you know it now.

>>generally unstable under TOS 7.x mode, but perfectly stable when I
>
>My system is stable with TOS 7.x, I can't use TOS 4 because I can
>boot on my old IDE disk (with delay on IDE checked).

I see. Well. then it's very good luck that you can use 7.x mode stably.
I just hope this luck holds during the summer, as my own problems are
such that increased heat worsens the problems.

>>use TOS 4.x mode, with FastRAM activated by Maddalt.
>
>Strange, your problems disapears in TOS 4...

Yes, they do.

>What is your DSP problems with TOS 7 ?

DSP acts identically under TOS 4.x and TOS 7.x, so there is no difference.
Apart from the strange results I have reported for MGPL-110, I have no
problems with the DSP.

>For example system can be frozen in XBIOS DSP function. I can't see
>hardware differences between TOS 4 and 7 except MMU...

I agree, but the PMMU mapping of TOS 7 mode is a very significant problem
indeed, at least for my system.

----- snip ----- re: my CT2B problems in TOS 7.x mode
>
>What is symptoms ?

Spontaneous freezing and/or bombing, with no apparent 'provocation'.

>>I don't care if it is the *same* clock or not. The fact is that both FPU
>>and DSP run at 32 MHz in compatibility mode and at 50 MHz in TOS 4.x and
>>TOS 7.x modes on an unmodified CT2B.

>
>I havn't modified my CT2B, I have only connected DSP clock to 50 Mhz oscillator.

Yes, I know. Bad phrasing perhaps, but what I meant was that your CT2B
installation is modified, even if your CT2B board is not modified.

----- snip ----- re: programs that use DSP interrupts
>
>I don't know this player, I use Bob Tracker. Where I can found this player ?

It (or newer versions) should be available at most larger Atari ftp sites.
Usually in some area like /pub/atari/falcon/music/ (or .../sound/).
I could send it to you if you like, but I think it is rather old now.

>>I do have it, but only as PDF files, and GhostScript is not a convenient
>>tool for reading documents of several hundred pages.
>
>I know I have printed pages about MMU ;-)

Fortunately I do have the real processor manuals for both 68030 and 68040,
and the combined programming manual.

----- snip ----- re: Centek including DSP_IRQ in Dolmen ???
>
>Maybe it's only for CT2.

That would mean that a Dolmen version for Falcon is under way, which I doubt.
I have asked them about it earlier, and they said that they had dropped that
project.

>>You misunderstood. With SOFTWARE patch I got the frozen system, but with
>
>Ah sorry ! Do you have try without DSP delay ?

Yes, and that never made any difference to any of my tests.

>>the HARDWARE patch I got 24 bombs, both results in turbo mode with test
>
>Maybe low level of DSACK0 is bad. For test it I have connected trigger
>input of my scope to XHACK (U44) and normal input to DSACK0 signal.

That is highly unlikely. 74F outputs are very strong, more than six times
stronger than a corresponding 74LS output. and the diode I use should have
a voltage drop of appx 200 mV at the given current. The output should not
exceed 500 mV, and that is well out of any 'risky' regions.

>>program MGPL-110. Under same conditions Aniplayer works without errors,
>>so this has nothing to do with the signal levels.
>
>Aniplayer use only this interrupt in 65K colors (or screen 320 x 240 without GEM)
>and 'direct screen' checked.

I'm not sure I see what you mean.
I always use it without GEM windows, and the display looks like 'hicolour',

but it is not always easy to tell the difference from 256 colours, as this
too allows fairly high picture quality. I guess I have to boot in hicolour
to be sure that this mode is used then.

----- some tests later -----

Yes, Aniplayer does work when booted in hicolour mode and viewing MPEGs
with my hardware DSP patch active, and DSP_IRQ removed.

>IOL (output current for low level) of 74xx38 is better than 74xx05, so 2nd
>gate on final stage is normmaly useless.

True, and that was an 'ALS' type too, which is even better.

----- snip ----- re: confusion about CT2 revisions in INTERDSP.ZIP
>>

>
>I have made this files before latest info from Centek about new serie, so CT2
>is for CT2A ;-) You havn't bus connectors on a CT2B :-)))

Ok, I understand you now.

----- anip ----- re: On the need for the INTERDSP patch and DSP_IRQ drawbacks

>I know, I was hungry when Rodolphe has said 'This interrupt not exist
>on new CT2B' and another reason that I can't tell here.

I don't I understand you again. I don't see the connection with 'hunger'.
Are you sure you don't mean 'angry' rather than 'hungry' ?

Anger I would understand, when being told *after* installation about some
capability supposed to exist which is actually missing. I too felt a bit
angry about that.

----- snip ----- re: INTERDSP connection methods.
>
>I have insert a pin.
>Another example with U44, I have insert a pin in socket (pin 15).
>=> no solder, no pin cut.
>I can come back to my old Speed Resolution Card...

Ok, I see what you mean now. I too have used such connection methods in the
past, and they do have a serious drawback. As several different metals are
involved, touching each other, corrosion of some kind (mainly oxidization)
is inevitable. That is a benefit of soldering, that it encloses the area
where the metals touch in a gastight blob of lead. Thus no corrosion occurs.
(Except of the lead surface, which doesn't matter.)

----- snip ----- re: on avoiding mixuos about CT2 revisions

>That's right, maybe an example last flash on CT2A ?!
>(post by Robert Schaffner).

That is possible. I didn't think of that, as I assumed he had a CT2B.

>Mario's ones come with TOS2.06, you option wether or not to fit it, it is
>unfortunately not switchable...

I haven't seen his board, but I assume it is based on EPROM sockets
wired for use of 27c01/27c1001 EPROMs normally used for TOS 2.06.

With access to an EPROM programmer it is very easy to change that.

1: Get TOS image files for the two TOS you want to use.

2: Buy 27c020/27c2001 chips to replace the 27c010/27c1001.
That makes room for 2 TOS.

3: Program each new EPROM to hold TOS 2.06 code in one half, and code
of the other TOS you want in the other half.

4: Buy a cheap SPDT switch and a 2.2 kohm resistor, and some isolated
multistranded connection wire. (low-current low-voltage type is ok)

5: Find some 'through-hole' or capacitor pin with +5V from the PSU,
near the TOS 2.06 board. Solder one end of the resistor to this
hole/pin, and bend the lead at the other end at a 90 degree angle,
so it points straight up. Leads at both ends should be less than
one cm in length.

6: Bend the top address pins of the new EPROM chips outwards, so they
don't enter the sockets, and don't touch any metal parts. Cut them
a bit if the pin length causes them to touch anything that conducts.
Insert the other pins into the sockets as usual.

7: Use the connection wire to connect the two 'bent' EPROM pins to each
other and also to the 'pull-up' resistor pin bent upwards in step 5.

8: Find a spot in the computer case where you can mount the switch in a
way that does not interfere with future service needs. Mount it there.
Use wire as above to connect the center terminal of the switch to the
same resistor pin that the 'bent' EPROM pins were connected to in step
7 above. Connect one of the switches 'outer' terminals to ground, and
the other to +5 volts from the PSU (eg: at the new resistor).

From then on you can use the new switch to select TOS before turning on the
computer. The switch simply sets the voltage of the top address bit of the
EPROMs high or low, thus choosing which half of the EPROMs will be accessed.

The same thing can be done using 27c040/27c4001 and two switches instead of
one, if you feel like having four TOS versions to choose from. :-)

I totally agree! NeoDesk 4 is awesome. We had a cook-off between
Thing/Magic (Dan Dreibelbis) and NeoDesk/Geneva(me) at a recent TAF mtg and
Neodesk acquited itself quite well thank you! :-) I surprised Dan by
running NeoDesk4 as an accessory in Magic/Thing! slowed Things(i.e
Magic) down a bit though [no kidding!] I also just registered Thing
for use with Magic, and possibly with nAES I just ordered from
Konstantin Woller.
btw, sorry about the garbled (potientally) text I sent previously.
NEWSies default for sending mail is UUencoded for me, and I forgot to
deselect it!

45. Boring day; New ST-Guide hypertext

Newsgroup: comp.sys.atari.st
Date: 1999-06-01 00:00:00 UTC
From: tkross@oio.net
Message-ID: <928215306.303.58@news.remarQ.com>
Source record: 77892

Well, for lack of anything better to do today, I decided to do up "The Communications Act of 1934" as a hypertext. It's the US law that established the Federal Communications Commission, and regulates US use of communications. It's the original version, without the amendments, but it is complete (except for Title II, which deals with telephones and telegraphs) and richly indexed. Useful information for Hams and other communications types.

Right now, I'm just adding some final touches, but I was wondering if there is a good repository of general-purpose (non-Atari-specific, that is) ST-Guides to upload it to?

Thanks

Terry

>ST with the graphics encryption busted to let it use ordinary Degas .PC1
>files.

Ok there has been a lot of discussion about this and suggestions that we can use other images, now Jane Jeston is a cartoon character and it remined me of that old Red Dwarf episode where the Cat and Lister are watching the Flintstones and decide the Wilma Flintstone is the most attractive woman in the world and so I was thinking that with reference to the above and at great risk of sounding warped and twisted that as the "Jane Jeston" strip poker game is based on a cartoon charcter perhaps someone with more artistic skill than myself could make suitable images of other cartoon women that we could use.
So how about the blonde from Scooby Do?, any other suggestions.

Stephen Moss.

Normally, you shouldn't need to change anything in the default.cfg

Did you set STing to Active in the STING.CPX ?

MEGA-ST, MEGA-STE and TT keyboards are all compatible.

> Also is it possible to repair a dead key on an Mega Ste keyboard
> and if so what do you look for, take apart and replace?

It probably is the Control key, right?

Anyways, near the metal shield's edge, you'll see that some
traces might be broken (use a magnifier glass to spot the
exact place of the break) and needs fixing.

This can be done using a tiny #30 wire (as described in a
Mario Becroft text once found on my TT FAQ - I'll have to
run it through an HTML filter and put it back soon) or with
highly specialized conductive fluid (looks like some silver
photocopy corrector fluid).

Otherwise, Best Electronics sells their own replacement
mylars, made of a slightly thicker and thougher material.

After starting aFTP I cannot enter any menu nor exit the programm.
The only solution is to reset a computer. The same was with the
previous versions of aFTP. What is the reason?
Programm is in version for STiNG.
My stuff is: MEGA STE 4MB, single TOS 2.06, monitor mono.

>data, and that the APPs that suffer from this are not suitable for use
>with this caching method, and the same naturally goes for those that
>make partial image updates. (eg: for animation of some image)

Yes, but I really doubt such applications are very common (as long as
only icon sized images are cached, that is).

>>For icon sized images I really don't think this is likely, but for general
>>images it might happen. If it does, just turn off the feature and live
>>with the slowdown.
>
>That is one way to do it, but if most do this, then the code serves no

I don't think most people would have to turn it off (certainly not for
most programs), and in any case it's just a few lines.

>>(It would be possible to make this selectable per virtual workstation.)
>
>That would be a better way to do it, although there would have to be some
>clever mechanism for making this 'automagical'. Possibly similar to how

Preferably. I don't intend to look into this for some time, though,
since there are more important things to work on.

>this VDI feature. Your idea of enabling this feature per workstation
>could be the best solution to this. Then the user can easily eliminate
>future such problems for a given APP when any such problems appear.

Actually, depending on how third part desktops do their icon drawing,
it might be enough in many cases to enable this only for a predefined
virtual workstation.

There might be some other applications beside desktops that could benefit
from icon caching, but I can't really think of any. The same goes for
caching of large images (a picture viewer probably wouldn't do many
redraws and image drawing/processing programs do updates).

>Free icon sizes do add some complexity, but it should not be very hard,
>especially in the kind of system where you plan to add caching of all
>kinds of bitmaps. The added complexity to keep track of image sizes
>will be needed for that as well.

Adding cache support for images of size of up 96x32 could be done with
very little effort (for those I wouldn't worry about wasting space, but
would simply allocate one or more 32x32 (which is probably the most
common size) blocks for each one).
More general image caching is something to consider later.
Fonts, fortunately, are handled completely inside the VDI, so there
should be no problems with them.

>I really wanted a height of 0, so as to get a pure text label without any
>icon image data. But the desktop routines do not like icons that have
>zero size, so I had to use a height of at least 1 pixel.

;-)

>Loadable drivers, with freely available specifications, is one of the
>ways to allow more participants to contribute to such enhancements,
>with wider support than the original author can provide.

Yes. In the case of fVDI, there will even be full sources available
for the whole thing (I'm not entirely sure the mach64 sources can be
made available, but I hope so), so there's no need to start from scratch
for other devices.

>That is bad. In fact it is even stupid. If more people knew how to code
>NVDI-compatible drivers, then all graphics cards for the TT would have
>such drivers. And then all TT users with such cards would also become
>NVDI users, which many of them are not today, lacking such drivers.

Actually, NVDI doesn't really need a card specific driver to do its most
useful things - text acceleration and TrueType/Speedo/PS fonts.
Any VDI that can supply an address for a function dispatcher callable as
a subroutine can be used as a 'device driver' for NVDI (which will then
do little but rendering of text to a monochrome buffer).
Naturally, fVDI can also be used in this way (only from v0.91 or so
since I'd never seen this 'feature' of the VDI documented anywhere).

NVDI5 is probably able to do some or perhaps even all of its new
dithering etc things using such a 'background' VDI too.

It depends which pin. Some pins aren't used on a monochrome monitor.
Does it work with the missing pin ?

If not, then you can either replace the connector, or take the connector
apart and just swap the broken pin with one that isn't used (pin#2 for
composite video should be ok).

Good, that might save a lot of us from crashes when testing progs that
'forget' to give any RAM back to the system.

>> In order to do this now one must always 'install' them first, to set a
>> limit for each particular program.
>
>Or use MiNT with a suitable MAXMEM-line in mint.cnf ;)

Yes, but I am not too fond of the way MiNT bends GEMDOS, so I avoid
using it. Those methods also make it very slow compared to MagiC,
which is what I mostly use. When I do want to use Geneva, as I
described before, I want to use it in 'stand-alone' mode.

>> They may be compatible in Geneva 6, I'm not entirely sure about that

Even GEM APPs can use several different ways of launching, and I had some
shel_write calls that worked fine in NAES and even MTOS, but not in Geneva.
I had to change some of the arguments to make Geneva do the very same thing.
I don't remember the details now though. In any case it should not matter
anymore if Geneva 6 is now fully compatible (almost :-) with the standard.

>AFAIK, you normally get a bus error if no device 'replies' to an access.

Yes, but some of the CT2 circuitry 'talks to itself' for this, so
it can ignore the signals from the Falcon. So I can write data to
these addresses without bus error and even do it in user mode. In
this example that doesn't matter, as this area really is ROM, so
nothing can be written there. But the usermode comment applies to
the next area too, with system vectors and variables. That is bad.

Centek have fixed that only by PMMU mapping, and only for TOS 7.x
mode, which never is fully stable on my system, so I don't use it.

>For significant acceleration of accesses to the normal Falcon bus.
>Everything else is independent of that decoding, naturally.

True. My own phrasing was unclear on that.

----- snip ----- re: The need for speed on the old Falcon bus
>
>It would not be as good as the CTII, but I don't think any other
>accelerator cards do much about this.

That is where I think they make a big mistake. It is true that
the screen scanning of VIDEL can take care of itself, and that
the CPU should rather run programs in FastRAM. But there are
many things for which ST-RAM use is inevitable. ST-RAM is
for example the only RAM that can be used for SCSI transfers,
so there will always be a need for fast massive data transfers
from this area. The same applies to all DMA based transfers.

And when CPU transfers such data out of the ST-RAM area there
can be no caching to improve speed, as cache is invalid after
DMA transfers. That is where the AB040 must really suffer in
comparison to CT2.

And don't forget that all system vectors and variables reside
here too, so that any inefficiency will also affect interrupt
service responses and other time-critical TOS operations.

(They _can_ be remapped, but with compatibility problems.)

My main point of all the above is that the speed with which
an accelerated CPU can access ST-RAM is still of very great
importance to overall system performance. And that becomes
more important still for systems used mainly for realtime
processing (eg: D2D operations, etc), and/or intensive disk
transfers.

>On the AB040, accesses on the
>Falcon bus are significantly slower than using the original '030.

I know. Due to lack of a good bus-sizer I've heard.

>>That, yes, plus the fact that many hardware registers are based on
>>triplets of bytes to form 24 bit addresses etc. These are not normal
>>ways of doing things in a machine with 32 bit busses, such as the
>>PPc was designed for.
>
>No, but as long as it's possible to do byte accesses at all, there
>is no real problem.

All the problems can certainly be solved, and im many ways, but it
is of great importance to find those ways that optimize both speed
and Atari TOS machine compatibility. And when I say the latter I
naturally mean the only TOS machine that Atari designed to use the
full address bus width, the TT030. It is always that address map,
or rather its rules and principles, that should be applied when
expanding the address width of a Falcon system.

Then the optimum compatibility will be achieved.
It will never be total, but it should be optimal.

IMHO CT2 as well as all other accelerators I've heard of have failed
in achieving that particular goal. Perhaps Tempest can do better ?

>>Recently designed chips are usually quite expensive at first.
>
>Well, microcontrollers usually aren't all that expensive, anyway.

My comment referred to the PPc, after you contradicted its high
age claimed by Robert Goldsmith.

But I see your point on the microcontrollers anyway, and it is valid,
but don't forget that their contents must be developed and debugged,
and that must be done by highly qualified technicians and programmers.
That is always expensive.

----- snip ----- re: PPc emulator 15 times faster than 32MHz '030

Ok, since I have no direct experience of these processors I'll just
have to suspend my doubts for the time being. I naturally want it
to be as fast and efficient as possible. The more great stuff that
is made available for the platform, the longer will it live. That

is to my benefit regardless of whether I myself get that equipment
or not.

>With 16+16kbyte cache, you shouldn't have to worry all that much about
>cache misses, anyway (depending on what you're doing, of course).

Of course. There are cases where huge data will be uncached, as I
described above. But for cachable data it should be very effective.

>Theoretically (assuming single cycles access times), a 100 MHz SDRAM
>can deliver 800 Mbyte/s, which should be plenty...

Isn't that a bit like specifying an eternal access burst on EDO SIMMs ?

>(I'm not saying that a 603e can get that kind of speed. It obviously
> won't get anywhere near under 68k emulation.)

The main point however is that it will be have much faster RAM than
any other accelerator.

----- snip ----- re: context switching, emulator mode & native mode
>>
>>That is one way of doing it, and I can think of others too, but the
>>big question here is not what can be done. It is: are they doing it ?
>
>If they aren't, I'll make sure they do. ;-)
>Anyway, it would be a simple thing to add at any point in time.

For the implementors, certainly. But it were best done before any
units are sold. Else there will be a lot of angry customers.

----- snip ----- re: more on context switching
>
>Again, a simple thing to do (implementing it in the first case, that is,
>not the patching), which I'd dare to guarantee will be possible.

I agree, it should be.

>>What good is a raw compiler without the support libs for the
>>new machine ?
>
>Just about every single library I've seen for the Atari has been
>completely (or almost so) C code, so what's the problem?

With well implemented context switching, applied as I described in
another post on 'wrapper functions' for the same purpose, it would
be possible to make gradual updates of virtually any libs and other
code, as unconverted functions would remain compatible with those
that have been converted. And by using reserved opcodes, as you
suggested, the context switching cost would be completly negligible.
(The same cost as a single NOP in fact.)

This also offers the first real hope of efficient debugging, as
all functions, both converted and unconverted, can cooperate with

all others, even in unrelated APPs or system functions.

Thus any software can be gradually converted, with testing of each converted component before going on to the next. That method is often capable of efficient debugging even without using a debugger.

>There would be no problem calling the standard TOS routines, as
>long as there is a way to switch over from PPC mode to emulation.

As far as we have now developed the ideas, and assuming that the 'multiprocessor' idea has been dropped, I do agree with you. It would also be no major problem then to gradually develop new, at first very partial, replacement overlays for BIOS, XBIOS and GEMDOS functions.

>>A hybrid lib is possible, switching back and forth between
>>native and emulation mode (to use gemdos etc), but it would,
>>as I said before, be a major development project in itself.
>
>Why?

That idea of a hybrid lib was simply my first glimpse of the idea that has now been developed into an idea for how to gradually convert any lib, or any other code, function by function.

>If the emulator itself works, there is very little more that needs
>to be done. I'm not saying that it will be an easy job to get the
>emulator 100% correct, though.

True, but if it can be done reasonably well in emulators for Intel processors (and it can), then it should at least be a lot easier to do it with a logically structured processor.

----- snip ----- re: negative effects of keeping the old '030 active

>>Agreed, but what can it do then ? The running software has reached a
>>point where access on the Falcon bus is needed, so what _good_ does it
>
>If the chip really needs access to the Falcon bus, there's of course
>nothing that can be done. The point is that you can go for a long time
>without needing that.

Yes, but every time that need arises an arbitration delay will occur, with timing based on the CPU speed of the old processor. That wastes a lot of the PPc power, and for repeated access this can happen over and over, as the old CPU will 'bounce back' as bus master each time that the PPc releases XBGK (BGACK).

The only way to eliminate these delays is to keep the CPU disabled all of the time, except in some special cases where it seems impossible to need to access that bus. But used in that way the CPU can't make any worthwhile contributions anyway.

>>then do that the tempest can access internally. It can't even service
>>any system interrupts, as those arise on the Falcon bus and will be
>>seen and handled by the old CPU when that is bus master. And that in
>
>Problems like that may indeed be difficult to handle.
>I wouldn't really bet on the dual processor thing being very useful
>even if it works.

I agree, and I really don't think it would ever work well.
I think we agree more or less fully on this now, so I'll cut some
of the passages below where this is merely confirmed again.

>>And how then do you make a CPU that may not use the operating system
>>at all obey your commands ?
>
>Give it a job to do in some way, for example by placing some kind of
>command in a given memory location that gets checked from time to time.
>Not overly efficient, but it would work.

That part is true, but you are forgetting something. This method
presumes that the CPU has somehow reached a stable program where
it is looping and awaiting some command semaphore. But how did
it get there ? Only one CPU can go through the boot process, and
that willbe the PPc. Who bootstrapped the CPU to its command loop,
and how was it done ?

There are ways to do it, but they are really not worthwhile.

>>Believe me, trying to let the old and slow processor work safely in
>>parallel to the main tempest CPU will cost so much extra ST-RAM access,
>>that all the work savings the old processor can provide will not repay
>>the losses, and much less gain us anything.
>
>No, the original processor would be rather useless, that's true.
>Something like an AB040 or CTII on the other hand might be nice to have.

True, but I think the incompatibility problems would be prohibitive.

>A PPC MiNT kernel (not to mention VDI and AES) would definitely be a
>good idea in any case. Fortunately, there isn't all that much assembly
>in MiNT, so it should be doable.

With the new ideas even assembler routines can be converted one by one.
All it takes is for someone with intimate knowledge of PPc coding to
write a collection of macros that implement a useful set of the PPc
instructions. Naturally that collection too can be gradually extended.

This might even be more efficient than a dedicated PPc assembler in
some ways, as that would require either that source files be split,
or that the whole lot be assembled in one go. (No gradual tests.)

>>That is the main design weakness of a standard Falcon, that
>>VIDEL blocks the CPU not only from updating screen, but also

>
>Well, there is only one ST-RAM so it obviously can't be accessed by
>two devices at once. I certainly would have liked to have some kind
>of FastRAM, though (I do now of course with my AB040).

Yes, FastRAM makes a huge difference, as accesses are not in any way
affected by the load on VIDEL. For that reason FastRAM would be
a priority even without CPU acceleration.

>Missing allways the read_file..

Sorry, I know no more than you of what they did,
but it did appear to make my system boot with a
little better stability.

For the first time I could even boot MagiC in the
TOS 7.x mode and continue for quite a while, in
some cases even a few hours, without bombing.
That was an improvement, but not good enough.

Using TOS 4.x and Maddalt to activate FastRAM I
get identical speed, but perfect stability. I
have run MagiC for several days without bombs
in this mode.

>Summer...humm..look lines under...

Yes, I'm quite worried myself as to whether my system will work in july
and august. After all, I know it wouldn't work even now in TOS 4.x if
I were to remove my extra fan. (2 minutes max before a freezeup)

>>such that increased heat worsens the problems.
>
>You know that when MMU is used, you obtain more heat ???!!!
>I can't see other differences between TOS 4.0x and 7.0x !

No, I didn't know that ! I suppose it makes some sense of course,
since the more complex mapping of TOS 7.x would increase the ATC
cache misses, leading to more intense bus activities in that area
of the chip, possibly overheating some nearby logic, such as the
ATC entry matching logic. And of course, if that 'goes' nothing
can work, and the CPU will probably halt very shortly.

>>----- snip ----- re: my CT2B problems in TOS 7.x mode

I definitely agree. IMHO it it the Lattice ispLSI chips that are alone
responsible for most of both the heat generation and the heat sensitivity
of the CT2. If I angle my fan in any other way than blowing cool air
directly at them, then they quickly get very hot, and then the system
eithr bombs or freezes.

Have you tried measuring the tempereature of the Lattice chips too ?

Krzysztof, it could be the TOS version, tho' I'm not sure. Requirements
speak about an AES version of 3.40 at least... so this is just a wildguess.
Actually, I never tried aFTP under singleTOS (3.06 here), just with MagiC
and Mintnet.

I thought Oasis 2 had inbuild base64 decoder.
I should say use a more up-to-date mail/newsreader like Okami and Newsie
and you won't have any trouble anymore to decode base64 messages.
Anyway you can find Esscd64.zip on the Belgium ftp-server
chapelie.rma.ac.be in atari/archivers.

I'm sorry to say but I think your OS is too outdated to run aFTP.
aFTP needs at least AES v. 3.30 to run properly. Which AES do you have?
TOS 3.06 for instance has AES 3.20.
You also need a desktop that supports the AV protocol (Thing 1.27).

IMHO it's time to invest some money in a more up-to-date OS like Geneva,
N_AES, MagiC. You surely won't regret the update as more and more program
are relying on a modern OS.

> those for sale on eBay and was wondering if they would fill the need. If
> so, is there an adapter for that model?

You can use the SC1224 on a Falcon, but it's a waste. Rather buy a standard VGA monitor, or maybe a SM124, at least for serius work.

Whatever monitor you buy must have an appropriate adapter to the D-sub 19 video port of the Falcon. Atari Corp. thought it would make life too easy for Falcon owners to have a standard VGA connector in the chassis. Ordinary VGA and SVGA monitors could then be plugged in straight. And we don't want that, do we? (...) The SM124 and SC1244 would still need adaptors, but that would be a minority of total users.

How about Mac monitors? Anyone tried that?

I've used a Sony GDM20E20 which has the peculiar Sun connector. An adapter to SVGA is connected to that one, then another adapter is connected to that adapter, F030 to VGA.

There ought to be a pool of extended settings for the Videl chip in combination with different monitors. Would help make the most out of each combination.

----- snip ----- re: problems with Thing under Geneva 6
>
>Hmmm... I thought I had tested Geneva with Thing a long time ago. I'll try
>to remember to look at this again.

This problem has been explained in other posts, but I'll repeat the conclusion here (in case you missed those).

Under multitasking Thing uses the shel_write variant that allows for setting a Malloc memory limit for the new application to be started. The default setting, used when a limit of zero is passed, should be that the program will not have any memory limit. Geneva instead sets a limit of zero bytes, which causes most programs to fail.

This problem only occurs when Geneva is used 'stand-alone', without MiNT that is, presumably because the Psetlimit function is used instead when doing the same thing under MiNT. It is Psetlimit which is defined to enforce no limit when the passed limit value is zero, so you will not find this info in all AES docs, as Psetlimit is MiNT gemdos, not AES.

Thing has a patch for this, and will have a workaround in next version, so there is no emergency status on this problem now, but it should be fixed for future Geneva releases anyway.

According to Mille Babic, you will attend NAS-99, and there you are bound to
meet lots of people who can get you a swedish TOS 2.06 (eg: Martin Graiter).
I'm not sure if I'll be there myself though, it depends on a lot of things,
I'm not yet sure of. If I do attend, then I too can fix it for you.

Hi 'Phantomm',

on Wed 02-06-1999 01:03 Phantomm wrote:

>Just got my CT2 v.B and I must say, its a nice looking board! :)

It is, and it gives great speed too, but take very great care in the
installation. Else you can scratch it all up on the 'experience' account.

This is not a project where shortcuts pay off. Take your time and do it
properly, thinking each step through before carrying out any of them.

NB: Centek themselves have reevaluated the installation difficulty and
will not deliver the next CT2 series to private customers for DIY
installation. They will have to send their Falcon motherboards to
Centek (or retailer) instead. All according to their latest mailpost.

>Even the disk that came with it Works! ;)

Good, because after the physical installation you must install the Flash
boot code. Without it, you can only use 16MHz compatibility mode safely.
Most boards come with pre-installed Flash contents though. (from tests ?)

>Before I start the installation, was wondering if there is any thing
>I should change or look out for that is not documented.

1: Fat capacitor

With CT2 in a position above the place where it will be installed, look
below the right edge of the CPU. There will be a fairly big capacitor
there. The size of this can vary, and some are so 'fat' that it will
prevent proper seating of CT2 in its connectors, because one of the
plastic clamps holding the CPU fan in place comes down on the middle
of that capacitor. If any attempt is made to 'push home' the CT2 at
this stage, it can damage the CPU and/or the CT2 board.

I had this problem, and fixed it by carefully snipping off the bottom
part of that plastic clamp.

2: High fan

The CPU fan is too high. Even when it is slid down to its lowest
position (it can slide up and down a little), it is still too high
to avoid touching some components on the keyboard, when that is
reinstalled.

I solved this by opening the keyboard, desoldering the resistors,
and then mounting them on the opposite side of the keyboard PCB,

so they will be inside the keyboard housing. That worked fine,
but don't do it if you have never opened an Atari keyboard before,
or at least be extremely careful. There are individual parts for
each key and they will be loose when keyboard PCB is removed, and
it is extremely easy to lose some of them. Also, take great care
not to damage the LEDs, as is easily done if not thinking of them
when removing the PCB.

If you can't or won't make this modification you'll have to do what
Centek recommend, which is to simply ignore the fact that keyboard
presses down on the CT2 CPU fan.

3: Shield plates

The top shield plate that covers the area above the expansion
connectors can not be reinstalled with CT2 installed. I chose
to cut away the parts that conflict with CT2, and keep all
the rest, including most of the PSU shield cage. This is because
I care about shielding both against HF RFI and against HV pulses.

This modification does demand special tools, and experience in
using them, so some people may prefer to just leave these shields
off when CT2 is installed. I know many do that even without it.

4: flat cable type

The documents clearly refer to a high quality multi-stranded type
of flat cable being used for the installation. Nevertheless, the
type delivered with my CT2 was a chep singlestranded type, not at
all suitable for individual connection to soldered joints, where
any bending back and forth of it will break that single strand.

I decided to use it anyway, so they wouldn't give me trouble later
about not having installed my CT2 'as supplied', but be very careful
with how you use it, and *never* remove insulation in such a way
as to leave that single strand 'nicked'. Else it will definitely
break at that point very soon.

aFTP requires that a competent AV_SERVER is installed, and running
in parallel to aFTP. This means you need multitasking and a desktop
with a good AV_SERVER implementation. The best available is Thing.

So, with Thing, and either of MagiC, NAES, Geneva, aFTP works fine.

NB: for error free use with Geneva without MiNT,
Thing will need the patch discussed in recent posts.

Why not ? You seem to be assuming that only one picture is being viewed,
but there could just as well be a whole sheaf of them, each in its own
window. I often do this when viewing illustrations that all belong to
the same main document or hardware project. I also quite often use CAB
with many windows. (Not just frames, but fully separate browser windows.)

But how is the linking to NVDI to be done then, and in such a way that
the appropriate subroutine will be used for various special resolutions ?

And how should such a function dispatcher be designed to be compatible.
(Required functions, parameter passing, result passing, etc.)

>Naturally, fVDI can also be used in this way (only from v0.91 or so
>since I'd never seen this 'feature' of the VDI documented anywhere).

That is possible, but without specifications for the interface it is
useless to any third-party developers.

Hmmm, if you have implemented a compatible interface, then your docs
should also be suitable for drivers intended for NVDI. Correct ?
If so, exactly where in your docs can this be found ?

It'll run version 2 OK, version 3 might run, but with next to nothing left for file space. If you have a lot of stuff version 2 will run out on as 1Mb machine, it always did on mine occasionally....lose all the Acc's you can, just keep the delay calculator and NVDI, if you have a memory problem then you'll have to lose them....try to get a memory upgrade from somewhere...

The <F> stands for <Fl;oppy>....your ST has an internal floppy but no TV modulator..

>(Required functions, parameter passing, result passing, etc.)

Actually, the thing NVDI wants is the normal VDI dispatcher, only
callable as a subroutine (that is, it can't end with RTE).
The interface used for the text output is the standard vrt_cpyfm().

Even the original Atari VDI can supply an address to such a routine,
so the 'trick' with removing NVDI's device drivers work with that too
(but it will of course be quite slow). I assume this has always been
used by the various GDOSes.

It's of course easy to call an underlying VDI even without such a
subroutine address, by faking a TRAP #2. This costs a couple of extra
instructions, but that is usually completely negligible. Actually, in
fVDI the subroutine in question does just that.
I've been calling the old VDI this way since day one in fVDI, as I
didn't implement all the necessary functions (even now a few things
(for example the vector exchange and mouse/keyboard input functions)
are delegated).

>>NVDI5 is probably able to do some or perhaps even all of its new
>>dithering etc things using such a 'background' VDI too.
>
>That is possible, but without specifications for the interface it is
>useless to any third-party developers.

But the interface in question is the normal VDI calls. For the dithering
functions I'd assume that a vro_cpyfm() is used.

>Hmmm, if you have implemented a compatible interface, then your docs
>should also be suitable for drivers intended for NVDI. Correct ?

No, this is quite separate from the normal NVDI device driver concept
(which seems similar to the one fVDI uses).
With the 'background VDI' method, NVDI isn't really involved in most
of the operations at all, it simply passes them straight through. The
device drivers on the other hand can take over specific functions
(I think the standard screen mode ones only handle colour palette setting

and perhaps a couple of similar things).

>If so, exactly where in your docs can this be found ?

There's aren't any actual fVDI programming docs at this time, only
some example source code.
IIRC, the undocumented 'return dispatcher address' VDI call is accessed
by handing in -1 instead of $73 in register d0.

Sorry Neil, I didn't know that was your pic. Prior to even starting my web page (over the last couple of years), I've grabbed sooo many Atari-related images off the web I don't remember where they all came from. I just had a folder full of Atari-related images, and threw that one up for that page at the time.

And as far as comments, I guess I never realized or noticed you could put something in there - as I don't often view GIFs in a text editor! :^)

I'll replace the picture with something else if you like (don't want to offend anyone). I've got a scanner, and tons of old COMPUTE and video game magazines, and I had planned to get some good Atari material from there anyway.

I've always liked Betty Rubble more than Wilma Flintstone. There's a Betty
KiSS doll that could be used to make a Strip Poker set.

Most of the images for the Sailor Mercury Strip Poker set were taken from Kiss
dolls.

~^
>So how about the blonde from Scooby Do?, any other suggestions.
~^

Daphani is okay, but the one from Scooby Do that always turned me on was
Thelma. I've always been attracted to the quiet, brainy girls. I think
her glasses and knee socks are cute and there was one episode of
Scooby Do that showed her in a bathing suit and it turns out she's
hiding quite a nice body under that oversized sweater she wears.

Hey, Thelma is the original "Geek Grrrrl".

Maybe I'll have to make a Thelma strip poker disk too. I'm going to have
to search for something to edit the sprites in that game first. I really
need to be able to free up more of the pallet.

CRACKERS
(Picturing Thelma surfing the web in her underware from hell!!)

PS. yes, "underware" was spelt that way intentionally.

Hello everyone, but particularly STinG users

Version 1.0 of the EZ-IP clients I uploaded a day (or so) ago had a bug
that would bomb when falling back on using the built-in server address.

This bug is now fixed, and the version 1.1 archive is ready for download on
my homepage.

Thanks go to Olivier Booklage and Eabe Kuik of the beta testing crew
for reporting this error.

Actually I had tested the fallback routine early on, but then I had to test
the other modes too, and then I made a change that added the bug. And I
forgot to test all ways again, as I should have.

100. Need Help Falcon HW Problem

Newsgroup: comp.sys.atari.st
Date: 1999-06-02 00:00:00 UTC
From: msaeger@xnet.com
Message-ID: <7j2773$in8$1@flood.xnet.com>
Source record: 77835

I left my Falcon turned on for most of the day yesterday. In the
afternoon when I returned I got several error messages. For example:
1. Trying to run Works(and other programs) I got "File is not
executable"
2. Opening up a Drive: Not enough memory
3. Playing a .AVR file: sound has "static"0
4. Trying to run MagiC: bombs

Leaving the Falcon turned off over night -- now it seems fine.

Something seems to be heat sensitive. Is it my memory, or memory
controller, or DSP? Any Ideas?

101. Re: Atari/iMac disk conversion

Newsgroup: comp.sys.atari.st
Date: 1999-06-02 00:00:00 UTC

Well, you can always use PC exchange. Format a disk on the iMAC using PC exhange and then bring it over to the Atari, copy the files needed on the disk and bring it back to the iMAC. Simple as that. All iMACs have PC Exchange so you don't need to worry about finding it.

Josh

Source record: 77838

* L E T ' S G E T O N E T H I N G S T R A I G H T *

(And I'm not picking on you, I just think we need to set a protocol
here in this news group as it has been needed to set in any news group.)

When you sell an item, you set a price, and you advertise it here.
You start the title with a "FS" for "FOR SALE" to indicate an item and a
price is listed within the message.

If you have an item to auction and a link to something important, you
type "FA" for "FOR AUCTION". This will let the reader know that this is
an item that the price is not decided on, but can be looked into and bid
for.

Both are great. "FS" items generally sale faster and are generally not
worth checking if more than a day or two. However, a "FA" item could be
good for up to seven days on the e-bay.

What do the rest of you think? I think proper labling of sale/auction
items is key in any newsgroup.

107. Cubase Audio won't shrink :(

Newsgroup: comp.sys.atari.st
Date: 1999-06-02 00:00:00 UTC
From: Maurits van de Kamp <maurits@SPAMBLOCKbassment.demon.nl>
Message-ID: <3754E006.983A4893@SPAMBLOCKbassment.demon.nl>
Source record: 77842

Heya!

As most ppl know by now :) I've been a happy Cubase Audio Falcon user for years now. Recently though I've stumbled on a problem: Selecting "erase unused" from the audio pool doesn't work on a lot of my audio recordings, even though it reports it can shrink it to like 48% of the original size.

CAF just starts shrinking, seems to do a lot of work, then recreates the image, and the result is.. exactly the same as it started. Still a large unused part in the audiofile, no change at all.

On some files it still does work. The only regularity I can find in this (but I'm not sure, might be coincidence) is that shrinking doesn't work on files that were imported into CAF instead of recorded in the same song I'm trying to shrink it in. To be more precise, I've noticed this on songs I've imported from ADATREC recordings, and also a song which used to be in 16-track compressed mode and was converted back to 8-track (and hence re-imported into the audio pool).

If this is the case, how can I make CAF think it's really dealing with it's own recordings? And if not, what else can be the problem? I really need to solve this, because I've got a lot of unused stuff to get rid of (large recording project), and the only other way I can think of to do this, is passing all the segments to the offline menu, and copying them to individual samples and then importing them back. But with this many segments, naah..:)

Help!! :)

Maurits.

Although an SC1224 will work, best results are obtained with a VGA
monitor on a Falcon030.

You can buy the adapter from your closest Atari dealer, or build one
yourself. There are instructions on building a multisync adapter in the
Quick FAQ, which is the same as a VGA adapter, except you should leave
out the little switch.

It's difficult to point you to a dealer because you forgot to state
where in the world you are.

> apart and replace?
>

Tricky. It's probably due to a broken membrane. If you are desperate,
you can take to whole keyboard assembly apart, and check all the traces
on the keyboard membrane. If you find a broken trace, you can try
repairing it with the stuff you get from auto shops for repairing rear
windscreen demisters.

Source record: 77645

```
-> And this is the new cron entry:
->
->if [ -x /usr/sbin/cron ]; then
-> echo -n " cron"
->fi
```

Hmm...okay, when I printed the README!.MINT file out, I apparently lost
some stuff. The new cron entry should have been:

```
if [ -x /usr/sbin/cron ]; then
UNIXMODE="/brUs"; export UNIXMODE
(cd /var/cron && /usr/sbin/cron >&/dev/null || echo "/etc/rc: cannot cd to /var/cron")
echo -n " cron"
fi
```

So I'm thinking, "ah-ha" but sorry, this did not work either. I changed my
/etc/rc file to reflect the new cron entry, and it won't even boot up like
its supposed to. Using the above, I get this error:

```
/etc/rc number 59 syntax error; fd number.
```

Well, thats where I am right now... ;-)

Thanks in advance for any help!

I never take short cuts when it comes to electronics. I finished a
good electronics course years ago. I'm no master but projects such as
these are no problem for me as long as I am physically up to doing it
and the parts are all in working condition.

I've had my Falcon apart many times. At present I have a Expose
installed, slighty modified to work correctly and also the Buffer
Modification from a 25/50 Nemesis. Both the Expose and Nemesis Buffer
work fine. However the main Nemesis board is another story. I am
almost positive that I have a bad chip or chips on the Nemesis board.
It could be simply a oscillator, but I got so discussed with it after
trying 4 or 5 times to get it working that I never bothered ordering
replacement oscillators. Also the original disk that came with it
was damaged. Titan was of no help either. My e-mails regarding the
signs and symptoms of Nemesis problems never answered.
I was extremely careful with the Nemesis installation and wanted it
to work real bad. I understand that stuff can get damaged during
shipping and etc. But to ignore my e-mails when I have a problem
with one of there products doesn't help matters.

I got a big sigh of relief went the directory of the CT2 disk came up.
I've a good feeling that the CT2 board I have is a good one. ;)

ok, I see what ya mean. I do have a fairly large capacitor there. And
the CT2 Fan does stick out a bit. I compared the length of the CT2 v.
B board with the Expose. The Expose board is about 2 inches longer
than the CT2. But the CT2 is a bit wider than the Expose board.
I may have to snip that plastic clamp, thanks for the tip.

I notice that 2 top corners on my CT2 fan look like that have already
been snipped. I assume this was done to help with the keyboard/fan
problem. Did your CT2 come this way?
And is the fan so high that it actually causes the keyboard not to sit
even or does it just barely touch the fan?

I took my STE's keyboard apart once to re-solder loose joystick/mouse ports. I think my Falcons joystick/mouse ports may need this attention as well. I might as well do both if the keyboard does not sit correctly.

The cable I received is grey and just like a 50 pin ribbon cable. All wires are connected together with a thin piece of insulation.

I have some general questions about the CT2 v.B, I've not completely read the documentation yet so I hope I'm not asking something that is already covered. I'm not going to do any thing that will void the warrantee on the CT2 v.B until I have it working correctly.

Since I have a working Expose, I would very much like to use it with the CT2 v.B board if possible. I know it is next to impossible to have both boards in a standard Falcon case. The only way I can see that I might could use the Expose with the CT2 in a standard case would be to use some ribbon cables and run the Expose outside of the Falcons case. I'd much rather get sometype of replacement case for the Falcon than do the above. However, I'm not sure if the Expose will work with

the CT2 v.B if sometype of pass thru connections are made.
Do you or anyone else know if the Expose will work with the CT2 v.B?
If so, should the Expose be on the bottom with the CT2 v.B on the Top
or the other way around? Does it matter?
If it does work will I be able to use all that extra memory with Apex
Media to grab video?
(Mike Where are ya?) ;)

Also, does the CT2 v.B have any effect on the Falcons cartridge port?
I have a VideoMaster Falcon cartridge, Will I still be able to use it
with the CT2 v.B?

Also, I do alot of D2D recording. Does the CT2 v.B have any negative
effects with D2D recording?

Are there any known problems with any 2.5 IDE hard drives with the
CT2 v.B? I have a Toshiba 2.5 6.4gig IDE will this one work
correctly?

And finally, I am looking for a replacement case for the Falcon if
I need to re-case it. I would like to find one especially designed
to do this. That has enough room for aftermarket cards and etc.
I really don't want to use a PC type case.
If anyone has one for sale/trade new or used then please e-mail me.
I'm in the USA, but would probably purchase one from overseas if
something could be arranged.

Thanks for your help,
phantomm@kih.net

Yes, but that is probably on fairly wide-open test boards. In a real
system and running above specified speed, some cooling is called for.
But the mistake lies in not arranging it so that the other CT2 chips
(ie: the Lattice chips) also share this cooling.

'This' cooler, and its arrangement, is a bad idea.
The question is how best to replace it. Where did you get your fan,
and what type is it (perhaps it can be found here too).

117. FAD Help

Newsgroup: comp.sys.atari.st
Date: 1999-06-03 00:00:00 UTC
From: puffpuffin@aol.com
Message-ID: <19990603014956.04055.00000825@ng-ch1.aol.com>
Source record: 77699

Hi everyone,

I just purchased a Line Audio FAD and I need help. The docs suck rocks and it didn't even come with a disk! So here goes...

1. I downloaded CD Reader from the Soundpool web site but it doesn't seem to work. Every couple seconds, the CD skips. I know the CD is good too because regular CD players play it just fine. The German documentation doesn't help much either.

I have MATRIX.PRG installed (also from the Soundpool site) which I believe replaces FDI_INIT.PRG. I tried setting the SPDIF/JamIN switch both ways to no avail.

2. Is there any PD/shareware sound players that direct sound through the FAD? I tried AniPlayer and all I got was static. (Didier Mequignon, if you're here, how about adding this feature in a future upgrade? :))

3. Does MusiCom 2 from Compo work with the FAD? I can't seem to get it to work. I select 'Coaxial' in the DSP Input area and CD as the input source. No audio output though.

I do plan on buying AudioMaster in the future especially now that it's under 100UKP. But I'm waiting for Wizztronics.

I have a 14MB Falcon, 1.4GB IDE HD, VGA monitor, ExtenDOS Gold 3.1 and a Toshiba 4X CDROM drive.

Thanks in advance, Phil

Well, it's an ST, so it can run any ST versions of Cubase, that is
Cubase 2.0 or 3.0, not Cubase Audio. However, you only have 1Mb, so
Cubase will run in a sort of degraded mode, you will not be ablt to use
scoring or external modules. These require at least 2Mb of RAM.

You might want to e-mail or call Alex at ATY Computer in Oakland, California.

He installed my Nemesis, and he has installed CT2s as well as just about every other ST/Falcon accelerator out there.

He can be reached at:

I've had the same problems uploading to my [web site's] FTP site. I use NEWSie most of the time (with STinG), and occasionally, I'll be able to send several files quickly, and the directory will update after each one. But most of the time it will only update properly after the first file, then hang thereafter.

I've tried connecting through two different ISPs as well, with similar results.

I used to sometimes use MG-FTP, but it's been a while and I don't think I ever tried uploading with it. I'll have to try it agian, as well as the newest AFTP and see if the same problems come up.

I don't experience this with aFTP -- the directory is always updated correctly. But I remember older versions of aFTP hanging immediately after the upload was completed, though other factors may have been involved here (earlier versions of STinG combined with two ISPs not in use anymore).

No problemo, Paul. I visit many Atari pages, having seen my "borrowed"
graphics on a few occasions.

> And as far as comments, I guess I never realized or noticed you could put
> something in there - as I don't often view GIFs in a text editor! :^)

GrafTool displays comments. It's because of this program that I became
aware of comments in GIFs and JPEGs (some of them quite comical).

As far as I know there is no Atari program that can write comments, so I
studied the GIF specification and used qed to insert them. (A recent
batch conversion with Imagecopy to add interlacing ended up deleting all
the comments anyway.) Adding comments to JPEGs was easy, since Atari
software exists.

> I'll replace the picture with something else if you like (don't want to
> offend anyone). I've got a scanner, and tons of old COMPUTE and video
> game magazines, and I had planned to get some good Atari material from
> there anyway.

Go ahead and use it. In one way the pictures aren't mine in the first
place, because they were scanned from magazines and promo material. But
I invested a great deal of time in many of them, and these were the ones
"marked".

My offer still stands if you require any help. It's fairly simple to
have a graphic blend into a web page's non-white background (like the
blue you're using). A few steps in a half-decent paint program will do
the trick.

>partitions but TOS won't mount them. What do I do?

You should be able to use BGM partitions for secondary partitions, but not
for the boot partition. That needs to be a GEM partition, and it has to
be the 'old' GEM partition type, not the TOS 1.04 type. Settings for that
exist in the ICD partitioning dialogs, but I don't remember the exact
terms they used now.

This means that the boot drive will be limited in size to 16 or 32 MB,
I don't remember which right now.

Also, if you make more than three partitions on a drive with ICD software,
then those further partitions will not be accessible from AHDI or HDDriver
software, as ICD used their own scheme for extra partitions. This may be
important if/when you decide to switch to using HDDriver in the future.

Oh, I see. I didnt realize that you meant this. I have actually used
that routine myself.

>Even the original Atari VDI can supply an address to such a routine,
>so the 'trick' with removing NVDI's device drivers work with that too
>(but it will of course be quite slow). I assume this has always been
>used by the various GDOSes.

Yes, that was why I used it, in a version of AMC_GDOS that I patched
for XBRA compliance in all vector bending. While slow, I found it
very useful for having some GDOS in ST machines with little memory.

>It's of course easy to call an underlying VDI even without such a
>subroutine address, by faking a TRAP #2. This costs a couple of extra
>instructions, but that is usually completely negligible. Actually, in
>fVDI the subroutine in question does just that.

Hmmm, there may be a problem with that method, if more stuff is linked
in the trap #2 vector. Letting the subroutine do it like a trap might
then invoke the overhead costs of those other dispatchers. I'm not
sure though. It depends on what you mean by 'faking a trap'.

----- digging in my memory banks -----

Hmmm, I just had a look in the sources to refresh my memory, and it
turns out that this is actually the driver called 'SCREEN.SYS' in
ASSIGN.SYS files, and in the structures that handle drivers, both
loadable and 'rommed', the subroutine address is stored in the same
element as the program start address of a loaded driver.

This should mean that the required 'behaviour' of loaded drivers
should be identical to that of this subroutine, although an enhanced
GDOS can naturally allow/demand some extra functions.

Note also that AMC_GDOS did not ever modify that subroutine address.
Even after installation of AMC_GDOS any program making a TRAP #2
call with d0 = 2, would still get a pointer to the same routine as
before AMC_GDOS was loaded. This means that the subroutine was not
intended to lead to a fullfledged VDI but only to a fairly simple
screen driver, not implementing any of the GDOS functions itself.
And that too fits the idea that this driver is really the archetype
of all loadable device drivers.

How do you deal with these things in fVDI ?

If this is true, many speedup possibilities exist for your driver, as
that does not seem to be implemented so, but rather as an alternative
entry point to the full VDI you implement.

Also, careful studies of this driver as implemented by TOS and with
comparisons to disassemblies of various (free) GDOS drivers should
lead to sufficient knowledge of the needed structures to allow the
construction of alternative screen drivers that should be compatible
with any Atari compliant GDOS. And that should (hopefully) include
NVDI too.

Btw:
I hope you implemented XBRA for this vector too, for it is a system
vector, even though it has no specific storage address. Anyone who
modifies any system vector must use XBRA, in this case as in others.

>I've been calling the old VDI this way since day one in fVDI, as I
>didn't implement all the necessary functions (even now a few things
>(for example the vector exchange and mouse/keyboard input functions)
>are delegated).

That sounds sensible to me, as there should be no reason to implement
such things any different regardless of the physical display methods.

>>>NVDI5 is probably able to do some or perhaps even all of its new
>>>dithering etc things using such a 'background' VDI too.
>>
>>That is possible, but without specifications for the interface it is
>>useless to any third-party developers.
>
>But the interface in question is the normal VDI calls. For the dithering
>functions I'd assume that a vro_cpyfm() is used.

Yes, I see now.

>>Hmmm, if you have implemented a compatible interface, then your docs
>>should also be suitable for drivers intended for NVDI. Correct ?
>
>No, this is quite separate from the normal NVDI device driver concept
>(which seems similar to the one fVDI uses).

I think they have to be very similar to original GDOS drivers for reasons
of compatibility, and that they in turn are compatible to original TOS VDI.

Given what I have seen in disassembly sources it has to be so.

>With the 'background VDI' method, NVDI isn't really involved in most
>of the operations at all, it simply passes them straight through. The
>device drivers on the other hand can take over specific functions
>(I think the standard screen mode ones only handle colour palette setting
> and perhaps a couple of similar things).

They are indeed rather small for a full VDI, but also rather big for just handling palettes, so we can take it for granted that some other stuff is also involved, but that most work is delegated.

>>If so, exactly where in your docs can this be found ?
>
>There's aren't any actual fVDI programming docs at this time, only
>some example source code.

Then I take it that you are not actually tied to any specific format for your own loadable drivers, such as you would be if that had been spread widely as an official fVDI doc.

This is good, because I think that further studies may result in enough info to allow fVDI greater compatibility to NVDI. Given the admittedly scant info already available, I believe it should be possible to achieve sufficient compatibility to make drivers mutually exchangeable.
(I may be wrong, but I hope not.)

What we need today is not more separate formats for such things, but more ways for related things to share common formats. If the standard for a loadable driver is indeed simply to support standard VDI operations in the same way that the TOS VDI subroutine does, and possibly even delegate some work to that routine, then such compatibility should be achievable.

>IIRC, the undocumented 'return dispatcher address' VDI call is accessed
>by handing in -1 instead of $73 in register d0.

It is indeed. In my programming libs I use the following macro:

```
;-----------------------------------
vq_driver MACRO
pea (-1).w
trap #2
ENDM
;-----------------------------------
```

>I may have to snip that plastic clamp, thanks for the tip.

Sounds like you have the same cap type I have there, and then you can
change the 'may have to' to 'must'.

----- snip ----- re: problem 2: High fan
>
>I notice that 2 top corners on my CT2 fan look like that have already
>been snipped. I assume this was done to help with the keyboard/fan
>problem. Did your CT2 come this way?

Yes it did. Centek are aware of the problem, but their snipping only
affects the corners, and that is not enough. And snipping the border
around the fan itself is not advisable. That could ruin the fan.

>And is the fan so high that it actually causes the keyboard not to sit
>even or does it just barely touch the fan?

With the resistors I mentioned in original places the keyboard did not sit straight, but could be 'wobbled' slightly, and when the cover was closed a lot of pressure would be applied at the point where resistors met the protective border of the fan. with the resistors moved inside the keyboard housing the keyboard PCB barely touches the fan border. They still touch, but no significant pressure is applied when closing the cover.

>I took my STE's keyboard apart once to re-solder loose joystick/mouse
>ports. I think my Falcons joystick/mouse ports may need this attention
>as well. I might as well do both if the keyboard does not sit
>correctly.

That is a good idea, in fact I did the same myself, as opening these keyboards is something I do as seldom as possible.

----- snip ----- re: problem 3: Shield plates
>
>I have a Dremel and like you would prefer to have some shielding.

Good. Just be careful when you make the extra cutout that will be needed for the fan, as that needs to extend inside the 'cage'. Use a margin of at least one mm to make sure that the plate does not press against any part of the fan.

----- snip ----- re: problem 4: flat cable type
>
>The cable I received is grey and just like a 50 pin ribbon cable.
>All wires are connected together with a thin piece of insulation.

Yes, but that describes virtually all ribbon cables. The difference I speak of is whether each separate wire has a single metal strand or has several strands twisted together. The latter type has much better mechanical stability, as the strands support each other in a flexible way not possible for a single stiff strand.

The instructions describe twisted multistranded wires, but the cable supplied had singlestranded wires.

>I have some general questions about the CT2 v.B, I've not completely

>case. I'd much rather get sometype of replacement case for the Falcon
>than do the above. However, I'm not sure if the Expose will work with

>the CT2 v.B if sometype of pass thru connections are made.
>Do you or anyone else know if the Expose will work with the CT2 v.B?

I do not now if that board will work with CT2B, regardless of connection method, but I do know that Centek have tested some graphics cards with the CT2B, connecting them by such methods, and that they did work. Unfortunately the Centek post did not say which graphics card(s) were tested this way.

>If so, should the Expose be on the bottom with the CT2 v.B on the Top
>or the other way around? Does it matter?

No board can be plugged on top of the CT2B, as it has no connectors, and no place for any such connectors to be installed, due both to the position of the FastRam SIMM socket and the position of the CPU with its heatsink and cooling fan.

Whatever method is used, any extra connectors between CT2B and the Falcon motherboard must be kept short and straight, for connecting them to each other any kind of cable is out.

>If it does work will I be able to use all that extra memory with Apex
>Media to grab video?
>(Mike Where are ya?) ;)

As I'm not sure how it is done I can give no absolute answer, but my guess is "no". By grabbing I assume you mean realtime dumping to disk, and direct DMA transfers are only possible from ST-RAM on the Falcon. The Falcon DMA chip can not access FastRAM, as it only drives 24 bits of the 32 bit address bus.

>Also, does the CT2 v.B have any effect on the Falcons cartridge port?

Yes. But the effect varies in different boot modes.

>I have a VideoMaster Falcon cartridge, Will I still be able to use it
>with the CT2 v.B?

I think so, but possibly not in turbo modes. That remains to be seen.

>Also, I do alot of D2D recording. Does the CT2 v.B have any negative
>effects with D2D recording?

I don't think so. Quite the opposite should be the case, as VIDEL and COMBEL have 50 MHz clocks instead of 32 MHz, and that means that all DMA operations should proceed swifter. But I can't verify this myself as I don't work with D2D at all.

>Are there any known problems with any 2.5 IDE hard drives with the
>CT2 v.B? I have a Toshiba 2.5 6.4gig IDE will this one work
>correctly?

I have heard of troubles with old ones, but 6.4 GB should mean a fairly modern drive, so it should work. I have no direct knowledge about that particular drive though.

>And finally, I am looking for a replacement case for the Falcon if
>I need to re-case it. I would like to find one especially designed
>to do this. That has enough room for aftermarket cards and etc.
>I really don't want to use a PC type case.
>If anyone has one for sale/trade new or used then please e-mail me.
>I'm in the USA, but would probably purchase one from overseas if
>something could be arranged.

I can't help with that, but hopefully someone else here can.

Yes, it would be nice. But I haven't decided for sure yet.
I'd like to be able to bring some machines if I go, but that won't
work if I have to go by train.

>Anyways, _who_ is going this year?

I don't know, except for you and a couple of guys from Gothenburg,
and I expect most Atarians in Gothenburg will drop in to check it
out, since it's so close for them.

>If someone happens to be coming from Finland (through the ferry)

When do you arrive in Stockholm ? Though I don't live inside the
city proper, I do live within the range of the subway system
(in fact my station is the end of a line), so I can reach 'Slussen'
in appx 45 minutes.

Even if I don't attend NAS, we could still meet for a few beers
or something, depending on your plans and the timing of course.

> Something seems to be heat sensitive. Is it my memory, or memory
> controller, or DSP? Any Ideas?

Do you have an accellerator board or memory board fitted?
If you have an accellerator board, there may be a problem with the overclocked CPU, so maybe you could try glueing a small heatsink on the CPU. If you have a memory board, it may be poor contact due to oxidation and you could try to remove the board and fit it back a couple of times and the oxides will probably be removed - or if may be oxides in the SIMM sockets on the memory board - then you should try to remove the SIMM:s and clean them with a fibre-glass pen, as well as the SIMM sockets and then insert the SIMM:s again.
If you don't have those add-ons, it may also be an oxide problem on the standard memory cards' connector or an oxide problem in the TOS socket (located under the memory card). The TOS ROM is a PLCC chip and you should take special care when lifting it out of the socket, since there's a risk of damaging the socket. The best way is to get hold of a special tool, called PLCC-lifter - it's much safer than using a small screwdriver and you don't risk cracking the socket in two pieces...

> this, is passing all the segments to the offline menu, and copying
them
> to individual samples and then importing them back. But with this many
> segments, naah..:)

I've found it a lot safer to make a "permanent mixdown" rather than using the "erase unused" function. It's often much faster to do it that way instead too...
To do this, you go to the "Hardware setup" menu and select "Mix" as input instead of the others. Then you simply choose the audio section in the arrange window you want to process and mute all other audio tracks. You should set the track to maximum output in the mixermap you use - otherwise you'll record with a lower volume. You set the Left and Right locators to the points that incorporates everything you want to keep and then you record on another track. If it's a stereo track you want to cut down a bit, you can only make a new recording on track 1 and 2 (with the ANY setting), so you'll have to move the original track to another track - for example track 3. The output will then come from track 3 and 4, so you should pan those tracks to the extreme left and right, as well as setting the to maximum volume in the mixermap and voilï¿½ - you've got your new track where the parts you don't need are erased. If you try to edit a stereo track that's moved elsewhere than track 1+2, you will only see one of the tracks in the audio editor, so don't be afraid if it's so - it's normal and you will still be able to record the complete stereo track. You can't lift the track out of the Pool and drop it directly on a track that doesn't have the "ANY" setting, so you have to drop it there and then move it to other tracks afterwards.

Best regards,
Claes

Thanks for this suggestion - I was planning to do a mixdown in the end
but I actually never considered it as an alternative to the shrink
function. :) With the huge load of data I have now (recorded a band's
entire repertoire onto 8 tracks with AdatRec) I'd prefer to make some
space first, but I guess it'll work as it is, too. It will be a lot of
work to remove little bits in between this way but they won't free much
space anyway, I can just as well leave them in in case I regret my cuts
later on or something. :)

Thanks!

Maurits.

> so, is there an adapter for that model?

An SC1224 would work, but would limit you to the lower (200 line)
resolutions, or force interlace for higher (400 line) resolutions.

If you are still interested, I have an early JVC-made "swayback" SC1224
in excellent condition along with a Falcon-to-Atari monitor block I would
be willing to sell.

BTW, the same monitor block works with both types of Atari monitors; the
SC1224/SC1435, and the SM124/SM125.

Hi

I do know where you can get them from, at a decent price;)

The problem is that I'll have to take it for granted that you are in the
UK!

Anyway depending what cartridges you want, depends on the price you have
to pay.

Try this address: www.transco.co.uk

This company can supply allsorts of storage media.

And no it's not the gas people, I thought exactly the same when I had it
given me.

Many years ago I read about a german word processor, "2:nd Word" which allowed you to tilt the monitor 90 degrees and thus have the more useful portrait orientation of the screen and program. Anyone here who can say how it worked?

This is quite a charming idea. Has anyone heard of other applications written in this way? When I come to think of it I'd like ALL my applications in portrait orientation...

They did consider a TT Centurbo for a while, but they gave up. :(As
they put it, the CT2 for the Falcon is the last bit of Atari development
they've done, from now on it's only Phenix stuff.

Just buy a Hades060 ;-)

Maurits.

On 2 Jun 1999 20:30:35 G, Ronald Andersson wrote:

Hi 'Phantomm',

Hi Ronald,

bad chip or chips on the Nemesis board. It could be simply a oscillator, but I got so discussed with it after trying 4 or 5 times to get it working that I never bothered ordering replacement oscillators. Also the original disk that came with it was damaged. Titan was of no help either. My e-mails regarding the signs and symptoms of Nemesis problems never answered. I was extremely careful with the Nemesis installation and wanted it to work real bad. I understand that stuff can get damaged during shipping and etc. But to ignore my e-mails when I have a problem with one of there products doesn't help matters.

:(. I have already commented on this subject many times... BTW, be sure the "HI" oscillator is installed and making good contact. I have problems if the socket is left open. Your Nemesis is the newer version, and I remember you saying they wanted something cut on the card during installation. Very strange....

Since I have a working Expose, I would very much like to use it with the CT2 v.B board if possible. I know it is next to impossible to have both boards in a standard Falcon case. The only way I can see that I might could use the Expose with the CT2 in a standard case would be to use some ribbon cables and run the Expose outside of the Falcons case. I'd much rather get sometype of replacement case for the Falcon than do the above.

I have ran my Mighty Sonic in this fashion, but the timing for that card is not near as critical as the timing for the CT2. However, it does seemed to be designed to "wait" for the Falcon to "cache up" for bus access. Even if you made a cable, it would have to be a loop, and would have the same effect as placing the CT2 outside the Falcon.
I think your like me, and probably never have the top hood on anyway:). I like the C-Lab case, but it is a tight fit for even two cards on the expansion pins, and it also holds

heat very well:(. The Falcon Rack is very roomy, but expensive. Lighthouse Towers in Germany at one time were inexpensive. I have considered placing my Falcon in a tower case, but the full size I have still just doesn't allow for an easy xfer. I think you need to get a server tower.

However, I'm not sure if the Expose will work with the CT2 v.B if sometype of pass thru connections are made. Do you or anyone else know if the
Expose will work with the CT2 v.B? If so, should the Expose be on the bottom with the CT2 v.B on the Top or the other way around? Does it matter?
If it does work will I be able to use all that extra memory with Apex Media to grab video?
(Mike Where are ya?) ;)

That's a hard one. I have a CT2B now, but won't be installing it very soon (until the 060 is working fully on the A/B, now fitting a bus sizer).
I have looked at the CT2B and decided that it will be the top card, if only for the reason that adding through pins on the Expose card will be an easier solder job. It doesn't make any difference to the Falcon which card is where from my experience. You might have to cut the jump trace on the Expose for it to work in the "first" card position. I had to do that with the ScreenEye.
The Expose card works independently of the Falcon (or CT2), and I am sure that Doug doesn't make any assumptions concerning the location of alternate ram as far as Apex is concerned. There should be no problems with the CT2. The Expose works fine on a 42Mhz bus, I can at least verify that. 128mb of raw video will be cool:).

Also, does the CT2 v.B have any effect on the Falcons cartridge port? I have a VideoMaster Falcon cartridge, Will I still be able to use it with the
CT2 v.B?

The VideoMaster works fine with alternate ram (set the flags), and works fine with a 24Mhz Falcon bus. I just discovered while checking the unit out for another user that M_Player will play the FLM files that VM creates. It can also disassemble them:). Way cool as it writes the video from memory to hard disk a thousand times faster than Apex (only in B&W). VM will work with a MSTE keyboard, but not a DEKA or other PC keyboard adapter.

Also, I do alot of D2D recording. Does the CT2 v.B have any negative effects with D2D recording?

Are there any known problems with any 2.5 IDE hard drives with the CT2 v.B? I have a Toshiba 2.5 6.4gig IDE will this

one work correctly?

I don't know anything about this, but I did see there were
tricks to use to get slower IDE drives to work. I wouldn't
think that the Toshiba would be considered a slow drive
however:). Probably this fix is for users of the old Conner
and 100mb Maxtors.......

And finally, I am looking for a replacement case for the
Falcon if I need to re-case it. I would like to find one
especially designed to do this. That has
enough room for aftermarket cards and etc. I really don't
want to use a PC type case.
If anyone has one for sale/trade new or used then please
e-mail me. I'm in the USA, but would probably purchase one
from overseas if something
could be arranged.

Thanks for your help, phantomm@kih.net

Good luck,

Mike
.

150. MiNT (cron) question.

Newsgroup: comp.sys.atari.st
Date: 1999-06-03 00:00:00 UTC
From: darkchyld@pcc-uky.campuscwix.net
Message-ID: <7j6bsa$no1$1@news.campuscwix.net>
Source record: 77732

Okay, I grabbed the cron 3 archive from ftp.funet.fi and am
trying to get it working. Setup seems pretty straight forward,
but... ;-)

I have:

/var/cron/tab/root
/var/cron/log
(I'm not using the allow or deny files)

/usr/sbin/cron
/usr/bin/crontab

(all the man pages are installed, come up fine)

I also changed my /etc/rc file:

Below (commented out) is the old crond entry:

```
#if [ -f /usr/etc/crond ]; then
# (cd /var/spool/cron; crond > /dev/null 2>&1 &)
# echo -n " crond"
#fi
```

And this is the new cron entry:

```
if [ -x /usr/sbin/cron ]; then
echo -n " cron"
fi
```

When I bootup, cron shows up as there-during the logon sequence,
but then 'echo -n " cron"' would show that, right? I can do a ps
and cron does not show up. I run crontab -e, setup what I want
it to do, and then wait. Nothing happens at all. (which is some
what of an improvement-the old crond version crashed) ;-)

Here is my tab file for root:

```
# DO NOT EDIT THIS FILE - edit the master and reinstall.
# (/tmp/crontab.121 installed on Thu Jun 3 11:50:46 1999)
# (Cron version -- $Id: crontab.c,v 2.13 1994/01/17 03:20:37 vixie Exp $)
55 11 * * * * echo "This is a test!"
```

As you can see, I was trying to get it to print out the line "This is
a test!" at 11:55am, any day, week, month, day of the week, etc,....

Anyone have any ideas? Thanks!

Dear London atari friends,

I have a little problem:
Iain Spence from London has sent me money for some software I'm selling,
but the problem is:
I don't remember which one he want to buy ... and in his letter he don't
mention which one he needed ...

Also, his Falcon is dead and he cannot receive or send any mail ...

I have talked to the international phone service to find his phone
number, but they say this guy has no phone number :(

If someone can contact him at 103, Harold Road Leytonstone I would be
very happy (and him also I suppose ...)

Thanks for any help ...

Perhaps could you simply find his phone number and then transmit it to
me ...

Any help appreciated.

Yours

Jo

Have you thought about coding the text with UDO [by Dirk Hagedorn]??
The tags are similar but with an UDO encoded text you can easily produce
and ST-Guide, HTML, Latex,WinHElp, ASCII, and awholelot more different formats...

Having used UDO - which is available on other platforms as well - you are
not restricted to our Atari platform ;)

My experience running Cubase 3 on my STf left something to be desired. I didn't like it. I use Cubase 3 on a TT030 and just love it. With 4 megs of memory I can run desk accessories and MROS programs like the Interactive Phrase thingie.

I suggest you look to upgrade to a Mega ST or TT030. The convenience of the detachable keyboard is worth the extra costs not to mention HD support and TT-High video resolution. Cubase looks and works great in TT-High. In fact during a session a while ago, the composer thought I was using a Mac :)

Thanks Rein - I've been contemplating looking into UDO, for other matters. As far as using it for the project I just did, it shouldn't be necessary since it's already in widespread distribution - I just wanted it immediately available to me from ST-Guide. I really should have clarified the "Non-Atari-Specific" part - I meant specific to ST-Guide, but a document not relating to Atari computers. I will investigate UDO though, since I have a couple of other projects I'm working on - thanks :)

Hi M-ER,

That would be Keith Scroggins. He bot all of Toad's left over Atari stuff and was selling it for cheap. I bot a few items for a nice price, and he was good to do business with. I tried accessing his page, and as you noted, it's no longer valid! :-(I hope he hasn't given up. Maybe he sold most of the items - I don't know. I looked to see if I still had his email, but couldn't find it. Good luck - and if you ever find that he has a new page, be sure and post the info.

Hi

I'm still waiting for Keith to get back to me as I don't give peoples
addresses out etc. without their permission.

I do know that he has used Ebay auctions in the past, so do an Atari or
Portfolio search. I will pass his info on if & when he gives me
permission.

The Falcon030 does indeed work with the SC1224 (or at least mine does!)

You can run a 768*576*32768/65536 colour desktop on this monitor, and
it will look gorgeous...I use Videl Inside 2 to setup the Videl to run
at that resolution.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Signature files are now in the form logname.sig (and quotefmt.inf is
logname.qfm). You need also to add there paths in o.inf:

sigfiles=i:\okami
quote.format.files=i:\okami

(cause I didn't move them in another folder)

The history file for the beta version is on Jos's site.

Bye,
/Pascal/

A main problem. Same here, several times. I quit that.
I doasnï¿½t like to waste my time with sensless emails, they doasnï¿½t
response. One and only part left here is apex.
Other parts, nemesised falcon included, i sell to other people.

> >2: High fan
> > --------
> > The CPU fan is too high. Even when it is slid down to its lowest

Some electronic stores had flat ones, very flat. (Notebook fan)
But we should not solder on CT2.. Cut wires, remove high fan.

My "A" board comes (last year) also with cuttet fan corners, but it
works. Keyboard doasnï¿½t touch the fan, but the lower corner of the
cooler block extremly near the -12 connector of the internal PSU.

A smaler bock would be nice, works in the same way..

> The cable I received is grey and just like a 50 pin ribbon cable.
> All wires are connected together with a thin piece of insulation.

Arghs..
They doasnï¿½t gave colorised flat wire? What a joke..
Itï¿½s allways better with colorised wires..

> I have some general questions about the CT2 v.B, I've not completely
> read the documentation yet so I hope I'm not asking something that is
> already covered. I'm not going to do any thing that will void the

> both boards in a standard Falcon case. The only way I can see that I

Same here with the screeneye. (Selled last week, i doasnï¿½t use it again)

CENTEK tells me that i have to put the screeneye below ct2.
That sound like to solder a slot to the backside of the srceeneye.

I do that, but i doasnï¿½t test it. I canï¿½t found the time, also i
selled the board last week. I think you can do the same with your
exposeï¿½. Thatï¿½s nearly the same as screeneye.

I canï¿½t found any word about that in any doc.

> might could use the Expose with the CT2 in a standard case would be
> to use some ribbon cables and run the Expose outside of the Falcons
> case. I'd much rather get sometype of replacement case for the Falcon

Yes, but were you like to connect the flat wire?
I think isnï¿½t a good idea, high bus clock an long flat wire are not
a nice couple..

> than do the above. However, I'm not sure if the Expose will work with
> the CT2 v.B if sometype of pass thru connections are made.
> Do you or anyone else know if the Expose will work with the CT2 v.B?
> If so, should the Expose be on the bottom with the CT2 v.B on the Top
> or the other way around? Does it matter?

Bottom, best way. Only way to find out, try it. I canï¿½t remember me that
anybody here use a second bus expansion since fit the ct2.

> If it does work will I be able to use all that extra memory with Apex
> Media to grab video?

Well, apex works fine with the ct2, but i doasnï¿½t check video grabbing..

> Also, does the CT2 v.B have any effect on the Falcons cartridge port?
> I have a VideoMaster Falcon cartridge, Will I still be able to use it
> with the CT2 v.B?

Sorry, doasnï¿½t have any answer for you. One an only i tested:
MidiCom Romport interface. Works fine! (Network beetween two falcons)

> Are there any known problems with any 2.5 IDE hard drives with the
> CT2 v.B? I have a Toshiba 2.5 6.4gig IDE will this one work
> correctly?

Original 64MB conner doasnï¿½t work in turbo mode.
Also a 540MB hitachi modell..
Also my old IBM DPES 31080 (SCSI) doasnï¿½t work with ct2 (turbo)

I use an toshiba 2.5" IDE drive (2.1MB) of the MAT series -> perfectly!
I think bigger ones works also fine.

> And finally, I am looking for a replacement case for the Falcon if
> I need to re-case it. I would like to find one especially designed
> to do this. That has enough room for aftermarket cards and etc.

Expensiv..
Tower or desktop cases looks nice, but also expensiv.

Older lighthouse cases had sharp metal corners!
Also the internal psu is NOT shilded!

Pentagon in germany sells a flat desktoper case, nice outfit, expensiv.

I create a flat desktopper case with transparent (smoke colored) acryl
glass, case have ALL holes for ports, floppy ect..
I doasnï¿½t use it.
(Can make a picture if i got the video board for my G3)

> I really don't want to use a PC type case.

Grey monster cases ;->

Apparently, they abandoned because they found fewer interrested buyers
than for the Falcon CT2.

Then again, for some developpers, it seems to me that simple math is
impossible for them. I recall reading that 18000 TTs were produced,
compared to about 5000 Falcons. It should be simple enough to figure
out which one has the best market potential, then....

www.radix.net/~kws/

No Atari info left, assides from a mention that he bought Toad's
overstock, in his CV.

I'll certainly be there, at least parts of some of the days.
I'll definitely bring my Eclipse along, most likely connected to my
AB040 Falcon.

I've come a lot further than that. It has been a few years, though,
so I don't remember the specific levels and I've forgotten where I put
my Dino Dudes password list.

If you could tell me what the password is for getting to level 10,
I'll turn the Jaguar on and take a look at it.
(I don't know if you're running on a Jaguar. Perhaps there weren't any
passwords in the other versions of the game?)

Old versions of MiNT do not change the partition size limits, as they go through TOS to access the filesystems. So if you were able to user these partitions with MiNT, you should also be able to use them without.

> >and am useing ICD drivers as I am unaware of any (free) replacement

There is nothing like a "TOS 1.04" type.

BGM partitions work for boot partitions in AHDI, CBHD, HuSHI and other drivers. If they don't with ICD's software, it's a bug in their driver.

> exist in the ICD partitioning dialogs, but I don't remember the exact

ICD allows to select the AHDI compatible partitioning schema.

Well, it's easy enough to invalidate the cache and after that you can
use the caching just fine. Normally, an AB040 setup would only disable
the caches for the video memory.

>And don't forget that all system vectors and variables reside
>here too, so that any inefficiency will also affect interrupt
>service responses and other time-critical TOS operations.

Yes, to some degree.

The AB040 Toolkit can relocate the TOS system stack to FastRAM and that
definitely speeds some things up a lot.

>>Theoretically (assuming single cycles access times), a 100 MHz SDRAM

>
>Isn't that a bit like specifying an eternal access burst on EDO SIMMs ?

Yes, you only get that kind of speed on eternal bursts. I'd assume a
PPC normally does 32 byte bursts, which would be something like 3-1-1-1
cycles or so.

In any case, the '030/'040 (don't know about the '060) only have 32 bit
data busses and their clock frequency is usually 50MHz or lower.
That would mean a maximum RAM bandwidth about a factor of four lower.

Yes, but on the other hand those other dispatchers might have a good
reason for being there.

>This should mean that the required 'behaviour' of loaded drivers
>should be identical to that of this subroutine, although an enhanced

NVDI drivers definitely don't need a dispatcher, but I guess they might
redirect things back into the main program immediately.
Anyway, I don't think they're compatible with the old GDOS ones.

>before AMC_GDOS was loaded. This means that the subroutine was not
>intended to lead to a fullfledged VDI but only to a fairly simple
>screen driver, not implementing any of the GDOS functions itself.
...
>How do you deal with these things in fVDI ?

Well, fVDI (like NVDI as far as I know) is an 'integrated' driver in
the sense that there is no separate GDOS. Thus, there is only one
dispatcher.

So far there are no printer drivers etc for fVDI so I'm not sure
what would be required for those (but I'm reasonably sure that I've
not done anything that would make them more difficult to write).

>If this is true, many speedup possibilities exist for your driver, as
>that does not seem to be implemented so, but rather as an alternative
>entry point to the full VDI you implement.

The dispatching is done via a function table anyway, so it doesn't
matter if only a small part of the possibilities are used.
Also, in the case of NVDI without drivers of its own, the background
VDI will actually have to deal with everything except the vst_/vqt_
calls and v_gtext/ftext/justified (and perhaps a few other things).

>construction of alternative screen drivers that should be compatible
>with any Atari compliant GDOS. And that should (hopefully) include
>NVDI too.

I don't think NVDI's drivers are compatible with the other GDOSes.

A 'screen driver' in the form of a background VDI really has to be
able to do just about everything (as described above).

In the case of fVDI, there's should really be no need to be compatible
with anyone else, since you could do one of the following things:
- Use fVDI as a background VDI.
The 'front' VDI would then take care of all non-screen devices
completely and pass most screen things through to fVDI (with text
output converted to vrt_cpyfm).
- Use fVDI as a front VDI.
fVDI will now deal directly will all devices it has drivers for
(currently only the screen). You can, however, set it up to pass
all operations on specific other handles (including the workstation
open/close calls, of course) through to the next VDI, and thus
still 'support' all hardware that VDI knows about.

In the first case screen operations will be slowed down a bit, but
you'll have access to all the font support etc of NVDI for example.
Non-screen devices will not notice fVDI.

In the second case it will be non-screen operations that are slowed
down, but they will still work fine. For now you'll have to make do
with the fVDI font support for the screen, though.
(In the future I intend to make it possible to use the background VDI
to draw text into a monochrome buffer which can then be blitted by fVDI.)

>I hope you implemented XBRA for this vector too, for it is a system
>vector, even though it has no specific storage address. Anyone who
>modifies any system vector must use XBRA, in this case as in others.

I never thought about it, but I could of course do that.
It's a bit risky, though, since nothing would work if fVDI was bypassed.

>>I've been calling the old VDI this way since day one in fVDI, as I
>>didn't implement all the necessary functions (even now a few things
>>(for example the vector exchange and mouse/keyboard input functions)
>>are delegated).
>
>That sounds sensible to me, as there should be no reason to implement
>such things any different regardless of the physical display methods.

Eventually I'll have to replace them, though, since not every system
that could potentially run fVDI will _have_ an old VDI to rely on.
For example, I'm planning to support Macs under MacMiNT.
(And the 'f' stands for (among other things) Fenix, which doesn't have
any other VDI either.)

>>There's aren't any actual fVDI programming docs at this time, only
>>some example source code.
>
>Then I take it that you are not actually tied to any specific format
>for your own loadable drivers, such as you would be if that had been
>spread widely as an official fVDI doc.

No, the driver interface is still in a state of flux.
Only about a week ago I had to change the mouse move/draw interface
rather substantially (only used for the RageII hardware mouse cursor
earlier, but in the new v0.93beta the bitplane drivers use it too).
There will definitely be more minor changes and probably a major
revision once 'all' things are working.

>This is good, because I think that further studies may result in enough
>info to allow fVDI greater compatibility to NVDI. Given the admittedly
>scant info already available, I believe it should be possible to achieve
>sufficient compatibility to make drivers mutually exchangeable.

I actually don't think there's much chance of that, but as described
above, it shouldn't really be necessary.

>What we need today is not more separate formats for such things, but more
>ways for related things to share common formats. If the standard for a
>loadable driver is indeed simply to support standard VDI operations in
>the same way that the TOS VDI subroutine does, and possibly even delegate
>some work to that routine, then such compatibility should be achievable.

That is not the way fVDI drivers are used at all, and at least the NVDI
screen drivers are also very different.

The fVDI drivers are in essence similar to the LineA functions. That is,
a selection of primitive operations that can be used to implement more
general ones. It is possible for a driver to replace a complete VDI
function (only for operations on that device of course) as well, though,
if necessary.

A basic fVDI driver would only contain pixel set/get routines and some
setup stuff. The main fVDI engine can then use those to perform any kind
of graphics operation (very slowly, naturally).
Various 'optimizations' are done by fVDI, such as using the mono-expand
routine for text output if a driver has the former but not the latter,
or using line drawing for solid fills if there's no fill routine.

G > format. I have several disks of clip art in *.tny format that
G > I use with my Atari, but I would also like to use the clipart
G > in some windows applications.

I can't answer your question, but ImageCopy will convert .tny's to
something your pc will eat.

Tiny format is just a compressed .neo (or Degas?), so you could
'unstuff' them, IIRC, with the same utility. Then you would need
something for the pc that would eat .neo's, which would probably be
just as hard to find. So... ImageCopy on your Atari is the right
answer.

What a shame.

What's so exciting about the Phenix by the way?
I've read the specs and it all looks nice, but why on earth should I buy a
Phenix?
What can it do that an Intel machine can't? It seems to me like buying an
odd piece
of harware and then praying to god every day that the company may live on
and
deliver drivers for it's hardware, spare parts etc.

Me thinks "open source" should include hardware as well. Specially for odd
products with a small market. Look at the tremendous success of the Linux
project. Everything is open and it works sometimes better than commercial
alternatives.

I'd really like to lay my hands on the ST simulator which was the embryo of
the ST series. A program simulated the new computer in toto on a VAX
workstation. This was pre-1985...

Does the Phenix exist otherwise than prototype?

> and
> deliver drivers for it's hardware, spare parts etc.

It is indeed a bit of a dilemma.. it contains all the Atari goodies but
they go through great lengths to explain to everybody that it is NOT an
Atari clone. But why on earth would I want to buy an 68060 computer in
1999 when it's something completely new? :) Well, of course it will be
more reliable than an Intel box since the Midi and Audio will have Atari
reliability (no crappy PC architecture) and of course all GEM-based GUIs
are great, but I'd rather stick to a machine that doesn't try it's best
to isolate itself from the Atari world.

Still, they apparantly did some market research amongst studios, and
apparantly a very large part of ppl interested in the Phenix had never
used an Atari before. So it looks like it is a nice bit of new
machinery, with just a slightly odd choice of processor. :) And as a
studio engineer, I must say purely looking at the specs and the price,
it's a nice set of studio gear.

> Me thinks "open source" should include hardware as well. Specially for odd
> products with a small market. Look at the tremendous success of the Linux

Interesting idea..:) Well actually the PC is sort of an open source
hardware project, and indeed it is the ONLY reason for the PC's success.
:) Pity it's such a load of crap. :)

> I'd really like to lay my hands on the ST simulator which was the embryo of
> the ST series. A program simulated the new computer in toto on a VAX
> workstation. This was pre-1985...

Kewl!! :) This should be available for download.. or should be running on some internet-connected VAX so we can run it remotely or something. :)

> Does the Phenix exist otherwise than prototype?

As I understood it, the Phenix exists now as a collection of hardware circuits which were all completed individually and shown at Atari shows and stuff. From their progress I would say that it won't take that long anymore for the Phenix to come out. But I think I'm more interested in a Hades. :)

> PS "Dolmen" means dick in Swedish...

:)

Maurits.

> Rumors..

That's definitely NOT !

In fact they NEVER were interested in ANY TT030 product; I remember I was speaking with them about their Falcon scanning program wanting to use it on my TT030 and they said; WE DON'T SUPPORT OLD MACHINES ANYMORE ... this was two years ago (maybe 3 ...) at a french show (the latest) ... so, some people (Guillaume Tello among them ...) were seriously hoping to make change their mind but they never succeeded because of their rather poor TT 030 oriented mind.

That's facts.

I have found this fan at factory, it's an ETRI Model 180DH 24VDC 2,16W
ref: 180DH2LP3100A
On FALCON computer, you have only 12V so I have found a solution :

```
+12V power-supply -----------+
| +
-+-
/ \ Fan 24V powered in 15V
\ /
-+-
33ohms | -
-5V RS422 +------====-------+
-|<|------+
on D9 1N914
mother Falcon's card
```

189. Mac disks can be read on a pc, and then read on the Atari

Newsgroup: comp.sys.atari.st
Date: 1999-06-04 00:00:00 UTC
From: Other World <slider@bertste.demon.co.uk>
Message-ID: <1OXtbAAoDAW3EwyA@bertste.demon.co.uk>
Source record: 77672

I recently asked if anyone knew how I could transfer files from a 2mg Macintosh floppy to the Atari.

I found a novel solution....

I found a small program 313kb that allows my PC to read MAC formatted disks directly, and then save the files to hard disk. I can access them on my PC and easily transfer them to my Atari using 720k Atari formatted disks.

It really is very easy, and allowed me access files from work, that I thought I would never be able to read without, MAC or PC exchange. and since it's only a few files, this has proved a very quick way.

just though it might interest someone, that's if it already isn't well known.

I'm the person who originally wrote Thomas Binder, and he sent me the workaround byte change to fix Thing for Geneva. This change did fix the problems I was having with Thing. Great service eh? Don't expect that from Microsoft.

I still have some unresolved problems with Geneva no matter what desktop I use. I leave the computer on most of the time, and frequently when I return to it, the display says "run acc has failed to terminate properly". I've never been able to determine the cause.

Perhaps all you TT-owners should contact Core (Titan) and tell them you're
interested in their "DesTTiny"-project. In theory it will make it possible
to connect Tempest and Eclipse to TTs, although only through a simulated
Falcon expansion-bus (i.e. 16 bit only).

Do not connect anything between two differend sources on ANY
switched psu! Reduce the risk to lost serial port, itï¿½s only
a -smal- regulator.

+12 -> GND
-5 -> GND
+5 -> GND

Any other way supports the risk of fire. (Lost psu, psu kills the
mainbord as result)

I have a friend whose Atari STE has a dead internal floppy disk drive.
I wondered if anyone could help answer a couple of questions?

1. Is it possible to read files saved on the Atari in 1st Word Plus on a
PC? If not, can these files be resaved by a third party's STE in such a
way that they can be read by a PC?

2. Can anyone recommend a reliable repair centre in the UK (preferably
Scotland) who will repair or replace the faulty disk drive?

Many thanks for your assistance.

Yes it will let you selct Hi Rez, if you use a softare program to
emulate the screen rez.

Sebra is a good one, I think its Freeware.

Comercially theres the Monulator.

The only other way is to get a Hi Rez monitor.

Bill,

I remember your messages on Genie. Never got it figured out, eh?

Since I've left my Mega STE on for long stretches of time as well, and seeing as how I've never encountered error, I'm at a loss. The wording makes it sound like one of your .ACCessories is crashing. I take it you've been putting off the normal troubleshooting technique for faulty or conflicting Desk ACCessories: disable them all, then reactivate them one at a time until the problem reappears.

(Any ACCs which do their work in the background, as opposed to processing only when their window is topped, would lead my 'suspect' list.)

Which screensaver are you using?

Tom

I've marked your error above. Your script is trying to redirect stdout
to a file descriptor with the "number" /dev/null, which of course is not
a number. Remove the ampersand and it should work.

Ciao

Thomas

>>
----- snip ----- re: static names for dynamic IP users (http://www.ez-ip.com/)
>
>Pardon my ignorance... but I would call up the local internet provider and ask
>for what?

The beauty of it is that you don't have to ask them anything.

If you have a dynamic IP and want a static name, you first browse to the URL "http://www.ez-ip.com/" and fill in their application form. Thereafter you will receive an email from them, either saying that the EZ-IP user name you wanted is already taken, or that it is now yours and that they have assigned an EZ-IP password for you to use with that name.

Next you browse to my hompage and get the EZ-IP clients available there (suitable for STinG or STiK or GlueSTiK+MiNT). The 'userpass' argument for those clients consists of the EZ-IP username followed by a colon and then the EZ-IP password. To simplify things you can simply put these in a DEFAULT.CFG variable definition.

If your EZ-IP user name is "yourname", then the static name in full will be "yourname.dyn.ez-ip.net". This is what you should give to your friends for use in their clients when contacting your machine. And if the password you got is "PaSsWoRd" then the DEFAULT.CFG variable definition should be:

EZIP_USERPASS = yourname:PaSsWoRd

And as always you must reboot before any change in DEFAULT.CFG is activated.

From then on you can use the EZIP_UPD client after each logon, and the EZIP_DEL client before logoff, and that will tell the EZ-IP nameserver all it needs to know, to be able to tell all users who try to 'resolve' your EZ-IP static name that the corresponding IP number is the dynamic IP number that you got for this session. And thanks to the EZIP_DEL client those who resolve when you are not logged in will get a message that your static name can't be resolved at that time. (Important!)

Your own Internet Service Provider is not involved in this process at all, so there is no need to speak to them to get this service, which is provided free of charge by the EZ-IP server.

Those who mean to make extensive use of this service need to study some of the info available at the EZ-IP URL given above, so as to get the most out of it.

Quick tips:

Don't use the EZ-IP clients at all when making short login sessions, as
this only wastes time. Use them only when you have planned for others to
access your own local servers.

Note that if you have BNet active and another BNet user contacts you,
(which you may not even notice) then he/she can do things you won't like
to your harddisk contents, such as renaming things or deleting things.
It is advisable to boot without BNet active if you want total protection
from such possible misuse. But some protection is given anyway in that
BNet will only accept calls from known 'partners'.

Similar risks can apply to the FTP server if you do not define a password
file (the file FTPUSERS) that limits access of anonymous users.

Such security measures are important when you want to make your machine
accessible to friends or the general public, but still have protection
against possible misuse.

Also, after a nameserver has 'seen' your IP it will not contact the EZ-IP
nameserver again for future queries until a period of 15 minutes has passed.
That means that there may be a 15 min delay from EZIP_DEL use until all
nameservers are prepared to use any new IP number resulting from a new
login you have made. During that interval users trying to find you may
get a wrong IP number (the one used in previous session).

Forgetting to use EZIP_DEL prolongs that period, so that the 15 min count
may begin at your next login with EZIP_UPD, and also may make you unpopular
with your ISP, as you have left the wrong IP number leading to their other
users (when they get that dynamic IP) active for a long time. For these
reasons you should always use EZIP_DEL to end a session in which you have
used EZIP_UPD.

Shortening that delay interval below 15 minutes is something that EZ-IP do
only for special contributors (meaning you pay), who can then also get some
other benefits. You can read more about these things at their site.

Well, if you have absorbed even half of the above, then you are no longer
ignorant on the EZ-IP subject... ;-)
So go ahead and try it !

Sure you can use the caching, but it will not give any real speedup
for the transferring of the newly arrived data, as none of it exists
in the cache. That is naturally true of any data that is newly arrived
by DMA methods. All of it will have to be read in from the physical RAM.

Of course, caching may help some if data can be 'bursted' into the
cache lines, but I'm not sure how/if that works in ST-RAM via COMBEL
and VIDEL.

>>And don't forget that all system vectors and variables reside

>>service responses and other time-critical TOS operations.
>
>Yes, to some degree.

The more frequent an interrupt is, the worse will this effect be, so
it is probably worst of all for really high speed communication ports,
and/or interrupts based on HSync (Timer B in count mode) which latter
are fortunately not in common use on the Falcon (they are on ST/STe).

>The AB040 Toolkit can relocate the TOS system stack to FastRAM and that
>definitely speeds some things up a lot.

Yes that should help a lot, as it is in very frequent use.

>>>Theoretically (assuming single cycles access times), a 100 MHz SDRAM
>>>can deliver 800 Mbyte/s, which should be plenty...

>PPC normally does 32 byte bursts, which would be something like 3-1-1-1
>cycles or so.

Well, that should be plenty fast anyway, compared to other types of RAM.
(I make it out to be 533 Mbyte/s.)

>In any case, the '030/'040 (don't know about the '060) only have 32 bit
>data busses and their clock frequency is usually 50MHz or lower.
>That would mean a maximum RAM bandwidth about a factor of four lower.

I don't think it is the clock frequency of the CPU that sets the limit
as much as it is the limitation of the RAM chips themselves. The CPU
speed only limits the resolution of the wait states that can and must
be inserted when accessing normal or EDO SIMM RAM.

I'm not arguing against your relative speed figure, that is probably right.
I'm just saying that the main reason for it is due to RAM type choice.

Never seen this. I have sometimes kept Geneva up and running for more
than 14 days running a GEM program doing calculations without problems.

Maybe any of your acc programs uses an internal counter that overflows?
This is not uncommon in the computer world: Win-95 has exactly this
problem in the OS itself and can crasch after about 47 days of use!

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Sorry, but I made one huge error in my last post in this thread.

The erroneous portion was this:

>Next you browse to my hompage and get the EZ-IP clients available there
>(suitable for STinG or STiK or GlueSTiK+MiNT).

I'm so used now to STinG's extended functions that I sometimes do forget
that they don't exist in STiK and GlueSTiK. This means that the clients
I spoke of are actually suitable *only* for STinG.

The plug (or even the one pin) can definitely be replaced. But ....
depending which pin it is it may not matter at all as only pins 1,4,9,11,12
and 13 are used for mono.

I think a firm called transco.(like the gas board)Still supply them "at a
price" But second hand ones can usually be found at computor shows & fairs.
I have a 44 meg built into my tower case. & set up as drive C It means I can
boot with any system I want just by changing cartriges & booting up,So Magic
on one Geneva on another, One in Game mode ie plain tos truecolour.The
posibilities are great, a cart for Mintos,one for Linux. Anything you like
in fact.
Pete.

From what I can gather you usually can use the smaller capacity
cartridges in the larger capacity EZ drives; e.g. EZ230 you can use the
EZ135 carts...

I've never tried it myself.

I may be putting my EZ135 drive with 11 disks up for sale as soon as
I've got hold of some more MO disks, if anyone has some spare;)

I know TUS answers the phone, but do they actually respond via mail for
enquiries! I asked for a price list and a list of what they do when I
took over Digiview PD, a couple of years ago, and never received a dicky
bird. I asked again a few weeks ago and not a sausage!

Does anyone know if they still do a decent service?

224. SH204 Problems

Newsgroup: comp.sys.atari.st
Date: 1999-06-05 00:00:00 UTC
From: jba4@po.CWRU.Edu
Message-ID: <7jcbn3kjc1@pale-rider.INS.CWRU.Edu>
Source record: 77618

I have recently acquired an SH204 Hard Disk system without the actual
disk dirve inside. I have the controller and the adaptec board all
mounted in the original atari case. Now, I've attached a ST251 to
the adaptec board. When I boot, my 1040STf is unable to use the
floppy drives. Furthermore, when I connect a ST277N SCSI drive with
proper termination to the Atari board, bypassing the adaptec board, I
encounter the same problem of not being able to use the floppies.
Does anybody have any suggestions? Both the ST251 and the ST277N
weer configured as drive 0. Any help is greatly appreciated. Thanks
in advance!

SS>I'd like to know, as I've been using a 3.5" for ages without any
SS>problems!!1
Me and a lot of other german users had a lot of problems with these
drives!

I was so happy with my 5.25" drive (44Mb) for years. But the 3.5"
drive (270 MB) I bought later went well for the first year and then
began to produce read/write errors a mass. :-)

Fortunately I could exchange several media on warranty. But it became
worse and worse, I could not even format (partition) the media, so I
was lucky to sell them to a guy who can use them (most of the time,
at least).

Finally I gave the drive away and bought a MO drive.

So please accept my congratulations for yours years without problems,
but I shall never again use a drive with removable cartridges based on
magnetical techniques.

And I suppose you know SyQuest doesn't exist anymore?

Peter

Atari
> Computing finally got me to purchase an FAD. I hope he can help.

Why don't you contact the manufacturer roger@lineaudio.se instead? I believe it's depending on the software. Some programs can provide the 44.1kHz clock internally or from the CAC, but I think Cubase uses the CAC only when you use the original analog input, so I believe you need a clock from an external source (like a DAT or other clock source) via an S/Pdif interface to make FAD's input work with Cubase Audio. I'm not absolutely certain about it, but if you contact Line Audio Design, I'm sure he'll be able to tell you what's needed.
For the output you need software that's designed to use an S/Pdif or FA8 or similar, for example Cubase Audio, AudioTracker, AudioMaster, Quincy etc.

Claes

7. WHY SHOULD I ATTEND NAS?
8. HOW YOU CAN FIND OUT MORE

Dear Atari friends, now it is only a week to NAS99.

It's once again time for the Nordic Atari Show, the annual get together
which has rapidly become a fixture for all Atari users.

We arrange the show for the fifth straight year we hope to fulfill
everyone's expectations and that this will result in the best possible
atmosphere.

In den letzten 5 Jahren ist die Nordic Atari Show zu einem festen Event
in der TOS-Szene herangereift, der mit jedem Mal besser besucht wird.
Austragungsort sind die Rï¿½umlichkeiten des Guttempler-Ordens Gï¿½teborg
in Schweden. Veranstalter ist die Swedish Atari User Association.
Gesucht werden weiterhin Atari-User, die Vortrï¿½ge zu bestimmten Themen
halten mï¿½chten.

1 - WHEN AND WHERE?

This year the show will begin on Friday, June 11 and end on Sunday, June 13. This is the weekend following the beginning of the summer school holidays as well as the weekend prior to the Swedish Midsummer celebrations. We'll open at 10 p.m. on Friday and close at 6 p.m. on Sunday.

NAS99 will be hosted at the IOGT-NTO (International Organization of Good Templars) quaters located in Gothenburg and between two places called Jï¿½rntorget and Masthuggstorget, just where the Stena Line ferries goes towards Denmark.

A map for the route description at http://www.sak.nu/nas/find.html

2 - WHAT WILL IT COST?

If you intend to attend all three days, you cheapest solution is the Three Day Pass otherwise a Single Entry ticket will do:

* Three Day Pass ... SEK 100:-
* Single Entry ..... SEK 60:-

These prices include full access to all the activities being held during NAS99.

3 - EXHIBITION

The exhibition hall is open:
Friday 11-20, Saturday 11-20 and Sunday 11-18.

At the exhibition you can see:

16/32 systems (England)
Nic Harlow has always been at NAS, so why any different this year?
He's sells CD:s for Atari, games and more.

SAK and SAK/Skane
The Swedish Atari Users' Association and the local department in Skane are here too, to show different programs and computer systems in action.

Jesper Brï¿½nnmark demostrates how a Atari ST can drive a lightshow with spotlights through the MIDI-ports for concerts or theatres. He also have compiled a GEM app called Moment that makes this possible.

Johan Klockars demostrates Eclipse with fVDI.

Daniel Hedberg and Thomas Bergstrï¿½m shows FlexTrax and Willies Adventures

4 - SEMINARS

Last years wide-screen seminars were very much appreciated, something of which we naturally have taken notice.

The SEMINARS will be held from 13 p.m. on Saturday

- Erik Hï¿½ll the author of MyMAIL describes the ethernet network part on NAS, how the computers are connected and the system software running, such as the Apache server installed on a Hades.

- Jonas Mï¿½ller Nielsen about MiNT/MiNTnet

- Kenneth Medin describes how his sub-net with Atari TT030 and Mega STe are serial connected to the main network.

Martin-Eric Racine will cooperate and show how he connected his TT030, iMac and Stacy to the network as well.

5 - MORE ACTIVITIES

* A very large ethernet network called Erika will be set up with several Hades machines,
SUN workstations and Linux platforms. A apache server is installed in one of the Hades machines with a Internet gate.
Two sub-nets called Pia and Sanna with a TT030s, Mega Ste, iMac and Stacy also connected.

* There will be a possibilty for you that can not show up at NAS, to surf the ethernet at NAS in real-time thanks to a Apache webserver installed on a Hades machine 1800-2100 Swedish time, more of this and the IP-adress to use, will be spread.

* Sadly Centek couldn't attend, their prototype R1 of the Phenix is not ready to show up at this time and they have important orders due september. Neither did I manage to get my grips on a MagiC Milan.

* A refreshment stand will sell non-alcoholic drinks, sweets, chips, etc.

6 - GENERAL RULES AT THE SHOW

* No smoking inside the building or by windows and doors.

* No alcohol, beer or anything like drugs will be tolerated inside the show. Please have fun with that outside in the city, but not at NAS99. All such things found will be confiscated, we are at IOGT-NTO as well.

* Keep a good attitude against other people and show your tickets to the staff if asked for it.

7 - WHY SHOULD I ATTEND NAS?

The Atari market now contains better apps and system software then ever before. We have seen that the TOS-compatible machines Hades and Milan actually was successful..

We think that you care about the TOS platform and that you will visit us not only to walk around but share your experience with us. If you are from the Scandinavian regions then concider that NAS is the only Atari show this year in Northern Europe.

NAS is for all of us a opportunity to gather, together for a few days
and let us know each other in person then electonically.

8 - HOW CAN I FIND OUT MORE?

Information will be distributed regularly in the same way as this text
file. In addition, we have a number of other sources of information
where you can find out more about the show depending on your own resources.

* Our home page on the World Wide Web. This has been in existence since
last two years and we'll try to update it as often as the information
comes. The home page will contain more detailed information
concerning times, schedule of events, directions on how to get there,
competitions and housing.

The addresses are http://www.sak.nu/nas and http://www.sak.nu

* STraight BBS. This is the Swedish Atari Club's home BBS. Information
concerning NAS will be included in the SAK menu. You can also use this
BBS to ask any questions you may have. The telephone number is:
+46 (0)31-336 39 73.

* The first issue this year of our club magazine "Atarimagasinet", will be
released at the show.

* Our show co-ordinator is this year as well as last year, Mille Babic.
He's supposed to know everything there is to know about NAS99.
If you have questions to which you've been
unable to get answers anywhere else you can send us a message at
nas@goteborg.utfors.se or to Mille at mille@atari.org

All members 1997- alreday got welcome info about NAS through
snailmail. You can also read this on-line (in swedish)
at http://www.sak.nu/nas/utskick.html

KEEP THE TOS PLATFORM ALIVE.
WE ARE LOOKING FORWARD TO SEE YOU AT THE NORDIC ATARI SHOW 1999!

Best Regards

Mille Babic

Phenix, Milan and Hades should concentrate to share the same bios etc,
think they already discussed this once? If so, we will be able to see a
new standard grow up for the Atari compatibles.

>Me thinks "open source" should include hardware as well. Specially for odd
>products with a small market. Look at the tremendous success of the Linux
>project. Everything is open and it works sometimes better than commercial
>alternatives.

Sounds like MiNT to me, the FreeMiNT 1.15.1 is really something, I spent
two hours today formatting my bootdrive, partition it and start to install
the system software, Falcon eXtender 40 MHz, screenblaster III and
bla bla and then did not managed to install the Linux filesystem ext2
but I am close. The RAW partition maybe should be called LNX.
Maybe someone could give me a hint?

>Does the Phenix exist otherwise than prototype?
Yes, Phenix R1
I could not manage to get my grips on it for the Gothenburg show :-(
The Centek folx have some important september orders to manage.

You might have trouble finding a PC program that can read 1WP files, but
there are several ways to convert them over if you have access to an Atari.
I have a page up on the web about this at:

http://www.whalley.demon.co.uk/atari/texts/wp_help.html

Note that this page doesn't mention (yet) the Marcel word processor which
handles RTF conversions (available from FTP sites). I suspect your best bet
would be the 1WP2RTF utility (try the Umich mirror at sunsite.doc.ic.ac.uk).

One can only try;)

>
>1. Is it possible to read files saved on the Atari in 1st Word Plus on a
>PC? If not, can these files be resaved by a third party's STE in such a
>way that they can be read by a PC?

Yes it can be done. Load it into 1ST Word+ and save the file in text
format only, deselecting the 'WP' option. This will give you text only
with NO embedded commands. I've not come across a pc program that will
read a 1st Word+ file.

To stick it on a disk that is PC friendly, all you need to do is format
a disk 720k on the PC and put the file onto it via the Atari. Unless you
use a formatting program like DC Format v3.0, my favourite by the way
(you couldn't tell, could you!), you wont get the pc to read it.

>
>2. Can anyone recommend a reliable repair centre in the UK (preferably
>Scotland) who will repair or replace the faulty disk drive?

I do every now and then have an Atari internal double sided drive spare.
At the moment I have one that needs the eject button, yours might be the
one it needs.

I'm in the UK and can sort both of your problems out;)

>
>There is nothing like a "TOS 1.04" type.

Yes there is. TOS earlier than TOS 1.04 used signed numbers in the FAT,
which made full use of the potential size of partitions impossible. That
was especially limiting for GEM partitions as they can only use a logical
sector size of 512 bytes.

From TOS 1.04 and on, GEM partitions can be twice as big as they could be
in earlier TOS, and TOS partitioning software usually allow the choice of
compatibility type to be set somewhere in the partition choice dialog.

Essentially GEM partitions are the same now as they were before. In fact
small GEM partitions are of course identical. But the largest size that
is allowed for TOS 1.04 was not a legal GEM partition size for older TOS.
Thus it is a new type of GEM partition, compared to the original specs.

----- snip ----- re: incompatible ICD partitioning scheme
>
>ICD allows to select the AHDI compatible partitioning schema.

They do have such a switch sure, but does that mean that all partitions
beyond the third will also be AHDI compatible...? I don't think so.

I've used the AHDI compatibility switch and it didn't have that effect
for me. I therefore think it refers to something else that ICD would
do differently from AHDI if this switch was not set.

Still, it was a long time since I used ICD software now, so others may
know this better than I do.

> monitor?

The most simple, but perhaps most expensive fix would be to see if Best Electronics has a replacement SM124 cable. I suspect that inside the monitor, the cable attaches to the PCB with a header type plug, and would be easy to replace.

The downside is that with the low price for used SM124's, the cable might end up costing almost as much as buying another monitor! Taking it into a computer shop would likely result in the same cost problem, but as long as they know where to get a DIN-13 plug, yes, they should be able to repair it.

> is that possible, and where would I buy the cables?
> james.

If your ST has an RF modulator, it also supplies color composite video output on pin #2 of the DIN-13 video port.
(See http://lwp.ualg.pt/docs/hwb/co_AtariStMonitor.html for details).

Since getting those 13-pin plugs to build a cable are difficult, you might want to consider drilling a couple of holes in your ST's case and adding a couple of RCA jacks for audio and video, and soldering the connections to the backside of the ST's video jack.

The quality of the output is not that good, put it will work. If you have an early ST with no video modulator, you are out of luck without extra hardware (like an old Practical Solutions Videokey).

Hi John,

actually: YES! Best way to do it is:

- start the Winbox, let it come to the desktop;
- don't touch anything, please! Don't start apps, don't slam the keyboard, don't open anything, don't mess with menu's or the startmenu, just keep your fingers where they belong!
- start timing....

That way, and IMO that way only it may (repeat: M-A-Y) get to 48 days without crashing...

As you may remember, I'm working on a freelance basis at our IT dept, since the beginning of May. We had 19 new HP Vectra's to configure for networking, installing the basic stuff (Win-95 was pre-installed). I don't recall how many times I had to re-install from scratch again before they all worked properly. Well, a few went in one go :-)

Meanwhile I got oldies back in to upgrade, both H/W and S/W, since several of them were running DOS or Win-3.11... There's only one good way to do that, start in DOS, deltree everything except <DOS> and the systemfiles, get WIN95 to the C: from the network and start installing. Tried a few leaving old S/W and somewhere during the "upgrade" they all went bezerk and you could start all over. Nice going with these fast P-75's!

Last week I had one 8 megger, installed Win-95, had it restart and it took 5 minutes to get to a desktop without the HD pprrrrttting around...
I switched the machine off, put 32 megs in it and next it did the job in around 1 minute.... :-) What were they advertising again in '95 when it came out? 4 megs needed, weren't they?

OK, now this is true. However I wouldn't call that a TOS
1.04 "specific" thing...

> They do have such a switch sure, but does that mean that all
partitions
> beyond the third will also be AHDI compatible...? I don't think so.

This is my understanding -- it would be the first time that I hear that
this actually is NOT compatible...

Cross-posted to: alt.atari.2600,rec.games.video.classic,comp.sys.atari.8bit,rec.games.video.atari,alt.atari.2600.vcs,pl.comp.sys.atari,fr.comp.sys.atari,comp.sys.atari.st

Here is a list of Classic Video Game stuff I have for trade. I'm looking for anything thats not on my list (games and manuals) at:

http://www.msu.edu/user/reicher6/2600.txt

I'm also looking for the following label variations

Slot Racers (yellow text label)
Sky Diver (red text label)
Flag Capture (green text label)
Video Chess (purple text label)
Hangman (red text label)
Brain Games (red text label)
Bowling (blue text label)
Basic Math (text label, no number)
Checkers (picture label)
Black Jack (picture label)
Code Breaker (two words 1986 release)
12 street racer (silver border)
21 video olympics (silver border)

If you have something that you think will interest me email me at

reicher6@pilot.msu.edu

I will (grumble, grumble) pay cash if need be, but I would rather trade for stuff. If you have some manuals for trade that I already have, try me anyway, I may need a certain style for my collection.

THE STUFF FOR TRADE

All Items are in good condition unless noted.

Atari 2600

Four switch model (left joystick port may not work) says "For Promotional Use Only" on the bottom
2600 jr. with instructions
2 atari joysticks

Raft Rider (no end label, faint name written on main label)
Sorcerers Apprentice
Sorcerers Apprentice (plaque on end label)
Final Approach (end label ware)
Taz (holes in tope corners of main label)

Road Runner (PAL, indentations on top corners of main label)
Sea Hawk (dirty label, name written in pink marker on main label)
Krull (holes in top corners of main label, end label peeling)
Backgammon (picture label, marker on end label)
Black Jack (green text label)
Combat (text label)
Indy 500 (picture label)
Oink (faded end label)
River Raid (blue label)
Othello (picture label)
Sky Diver (blue text label)
Basic Programming (red text label)
Surround (picture label, plaque)
Golf (gold text label)
Maze Craze (red text label)
Space Invaders (red text label)
Missle Command (lowercase letters)
Riddle of the Sphinx
Bridge
Seaquest
Tennis (screw holes)
Spider Fighter (plaque)
Dark Cavern
Astroblast

Atari 5200

Ball Blazer (complete)
Counter Measure
Q-Bert
Pole Position
Cenipede (complete, bad box top)
Qix
Qix
Star Raiders (with instructions)
Defender
Pac-Man

Atari 7800

Midnight Mutants (complete)
2 Joysticks

Atari Home Computers

Atari XE System (Plays in Black and White, fixable?) with power supply and
keyboard

Pac-man
Missle Command
Centipede

Basic (version C)
Q-Bert (no end label)
Final Legacy
Flip Flop and Frenzy (tape, complete)

Colecovision

Colecovision system with 2 working controllers and power supply
Colecovision system (no sound) with 2 controllers (not working) and power supply
Adam (white) controller (wont go up, fixable?)
Venture
Cosmic Avenger
Donkey Kong Jr. (minor label ware)

Odyssey2

Odyssey2 system in box with two working controllers and power supply
KC Munchkin (complete)
Speedwat Spinout Cryptologic (complete)
Cosmic Conflict (complete)
Pickaxe Pete
Alien Invaders Plus

Intellivision

O = overlay

Intellivision II system with 2 controllers and power supply
Triple Action (white) OO
Tron Deadly Discs (minor plaque) OO
Burger Time (major plaque) OO
Snafu O
Astrosmash (white) OO
Kool-Aid Man (major plaque) O
Lock N Chase (medium plaque) OO
Star Strike OO
Frogger (Parker Brothers)
Sharp Shot (minor plaque) OO
Bump N Jump (Major plaque)
Space Battle
Baseball (white) OO
Space Armada O
Beauty and the Beast OO
Night Stalker (Shrinkwrapped, but crushed)

Instructions

Barn Storming
Starmaster
2 Golf (booklet)
Air Sea Batlle (booklet)

Video Olympics (booklet)
Dodge em (booklet)
Combat (booklet)
Bowling (booklet)
Moon Patrol (B&W, multi-languages)
Defender
Sprint Master (minor tear, fixed with tape)
Asteroids
Bowling
Raiders of the Lost Ark
Midnight Magic
Alpha Beam wiht Ernie (overlay only)
Tutankham
Frogger
Robotron 2084 (7800)
One on One (7800)
4 Atari Catalogs (red, Rev. D)
Personal Computing on the Vic-20 (booklet)

yes Dave is a great engineer and honest his prices are fair he has fixed
and upped a few things for me and I have also bought a few upgrades to
fit myself I can thoroughly recommend TUS,I have heard before of no
answers to e.mails but I suppose he gets a lot of techie questions that
would take a lot of his time to answer,this is no excuse though for not
sending out a stock price list and letter,the web site is very spartan to
say the range of products and services he offers

Hi Paul,

Yes, Alex is very good at installing hardware mods from what I hear.
I bought my Nemesis from him.

However, I'd rather take my time and do it myself. There are a few
areas that I need to look at while doing the upgrade so that I'll know
which way to go in the future. Plus a few little tricks I'd like to
try also.

Thanks for the info,
phantomm@kih.net

Titan has made some nice hardware for the Falcon.
The Expose is very nice, except for a few small hardware
bugs that caused problems here in the US with NTSC.
I never did quite understand why the problem could not
have been fixed. I fixed mine quite easily once I got
hold of a good board and splitter.
I do hope they continue to create good hardware/software
for the Atari Platform. Hopefully they will start listening
and try to provide help with their customers better.

>----- snip ----- re: problem 2: High fan

>They still touch, but no significant pressure is applied when closing
>the cover.

Hmmm... I'm not sure why Centek chose this large Fan, but I bet it
does do a good job of cooling. I'd like to replace it with a much
smaller one but that would probably void the warrantee.
The Heat Sink is also large and is glued. I know better than to
try and remove it.

>That is a good idea, in fact I did the same myself, as opening these
>keyboards is something I do as seldom as possible.

I've been playing around with the idea to install the CT2 in the
standard case, and removing the Falcons keyboard and make some type
of case for it. This would leave more room for upgrades and etc
where the keyboard use to sit. Sometype of thin hard plastic could be

cut and fitted as a cover for the opening where the keyboard would
normally sit. Then, one might could put the keyboard on top of this
plastic cover. If there would be no problems with making the keyboard
connecting wires abit longer.

>----- snip ----- re: problem 3: Shield plates

>Good. Just be careful when you make the extra cutout that will be needed
>for the fan, as that needs to extend inside the 'cage'. Use a margin of
>at least one mm to make sure that the plate does not press against any

>better mechanical stability, as the strands support each other in a
>flexible way not possible for a single stiff strand.

>The instructions describe twisted multistranded wires, but the
>cable supplied had singlestranded wires.

After examining the ribbon cable more closely, mine also seems
to be single strands. And are very tiny, will have to be very
careful with those. Some type of extra insulation around each wire
might help with unwanted EMI and strengthen the wires too.

>I do not now if that board will work with CT2B, regardless of connection
>method, but I do know that Centek have tested some graphics cards with
>the CT2B, connecting them by such methods, and that they did work.
>Unfortunately the Centek post did not say which graphics card(s) were
>tested this way.

Hmmm...thats good to know, wish I knew which ones were tested.
And how exactly extra connections where used.
This would be very useful info if you or someone else could
find out for us.
I have a good idea on how this was done, but there are a few ways
of doing this.
I hope that more than one card can be connected to the CT2B at the
same time.

>No board can be plugged on top of the CT2B, as it has no connectors,
>and no place for any such connectors to be installed, due both to
>the position of the FastRam SIMM socket and the position of the CPU
>with its heatsink and cooling fan.

The only way I could see it be done on top of the CT2B would be
to solder connecting pins where the 2 bottom connectors are soldered
to the topside of the CT2B board. But they would have to be rather
long due to the Fast Ram socket and CPU Fan as you said.

However short ribbon cables might be placed on the pins or headers
if one needed to do this. It's just a thought.
It would be easier to place the CT2B on top of another card.

>Whatever method is used, any extra connectors between CT2B and the
>Falcon motherboard must be kept short and straight, for connecting
>them to each other any kind of cable is out.

Does the ribbon cable that connects to the CT2B board have to be
cut according to the documentation? I'd rather have them a little
longer if needed due to the possibility of connecting the CT2B on
top of another card in the future. Which might cause the wires on
the CT2B ribbon cable to end up short.

>As I'm not sure how it is done I can give no absolute answer, but my
>guess is "no". By grabbing I assume you mean realtime dumping to disk,
>and direct DMA transfers are only possible from ST-RAM on the Falcon.
>The Falcon DMA chip can not access FastRAM, as it only drives 24 bits
>of the 32 bit address bus.

The Expose grabs video in Memory first, then you can save it to
disk as a file. Also if I remember correctly the speed of the
frame grab rate is only limited by the Falcon Bus. So Faster
Bus should mean faster grab rate.
I think in later versions of Apex Media support for the Nemesis
and the AfterBurner where included.
Hopefully Expose will work great with the CT2. I'll be very happy
if I can use all the extra memory for video. And get a faster
grab rate as well.
If needed maybe Doug Little will add support for the CT2B in
Apex.

>I don't think so. Quite the opposite should be the case, as VIDEL and
>COMBEL have 50 MHz clocks instead of 32 MHz, and that means that all
>DMA operations should proceed swifter. But I can't verify this myself
>as I don't work with D2D at all.

ok, AFAIK with the CT2B one suppose to be able to return to
a stock Falcon if needed. Does this mean that all standard
clock speeds can still be used?

I have a few more general questions about the CT2B.
I do tend to ask alot of questions at times, just
trying to get as much info as possible hope no one
minds. ;)

The small resistor that is taped to the documentation,
there is no way this can be installed wrong is there?
Seems I read something about it could be incorrectly
installed upside down or something like that?

What is the best type of Memory to use on the CT2B?

I have a 16meg 72pin Simm that I use in my Falcon
with a Ram Karte memory board. Will this Simm work
correctly as Fast Ram in the CT2B?

Also, any known problems with after market memory
upgrade boards with the CT2B such as the Ram Karte
or the Ram Gizzmo?

Must one install a FPU in order to use the CT2B?

I notice in the documentation that a modification
to the Falcons VGA adapter may be needed for
extended resolutions with non multi-sync monitors.
I have a 17inch SVGA that I am using with the
ScreenBlaster II external hardware and software.
Can I still use the ScreenBlaster II hardware/software?
If so, does the ScreenBlaster II hardware fix the bug
with the VGA adapter that the documentation mentions?

Any additional info about the VGA modification and
what kind of extened video modes will not be
obtainable if this modification isn't done would
be helpful.

Someone told me awhile back that there was problems
with doing MIDI stuff with the CT2B.
This may only be a rumor.
Are there any know problems with MIDI?

When doing the CT2 wire soldering there is
a part where you have to remove the chip at
U44. Is it really necessary to break pin 15
of that chip and use it in the socket?
Or can one use a pin from a different chip
or maybe a componet leg like from a resistor?
I don't want to destroy this chip unless I have to.

And, I'd like to get a few extra Inductors that
are exactly like the one at L102 on the Falcon
Mother Board. Anyone know the technical info
on that inductor at L102?

Any help with this is appreciated,
phantomm@kih.net

Yes, the addenum stated and even had pictures showing
to remove the 2 capacitors on the Nemesis board on
the 25/50 version. I ask in this group before if someone
who has a Nemesis 25/50 installed to look and see if the
2 capacitors where removed or not and no one bothered to
look. Right now I really don't care as the CT2B should
stomp all over the Nemesis with Hard Toe Nail Boots. ;)

Great, This is going to be real nice if I can get it all
working. I'll be starting the installation soon.
Not sure where the jump trace is on the Expose.
Can you describe it a bit more?
I bet the grab frame rate is much faster with a 42Mhz bus
right?

>The VideoMaster works fine with alternate ram (set the

>DEKA or other PC keyboard adapter.

I'm a registered MPlayer user, Yes MPlayer does play
VM or VMF files. I've not tried to disassemble one yet. ;)
It would be nice if there was a hardware or software modification
that would allow VMF to grab color video as it will grab
video and sound at the same time. It does a real nice job
of doing that.

This may be a bit too much to ask,

I am in need of a good and large Hotlist file for Cab 2.5/2.7
that only contains Atari related Web sites. It would need
to include Falcon related sites as well. Atari 8-bit sites
would be acceptable as well.

I screwed mine up by accident and it would save me some time
if someone could e-mail me one.

thanks,
phantomm@kih.net

267. More Geek Grrrl Hentai For the ST

Newsgroup: comp.sys.atari.st
Date: 1999-06-06 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <7jd6j2$he@james.hwcn.org>
Source record: 77633

Did some more goofing with the Atari ST Strip Poker game and made up a new Geek Grrrl set. This time it's the original Geek Grrrl, Velma Dinkley from Scooby Doo.

Unlike with the Sailor Mercury Strip Poker game where I pretty much pulled the hentai from KiSS dolls or other pics found on the net. I had to draw all the Velma pics myself (search as I could I could find no Velma hentai on the net).

And while we're on the subject of building Teen Queen sets. It turns out all you need for the Data Disks is the .PC1 files (files 0 to 12, file 13 is the title page and unless it's on the disk you boot the game from it won't be used). The SOUNDS.ECH file seems to be uneditable. I replaced certain samples in it with actual Velma samples found on the net but the sounds wouldn't play. Oh well, the french voice is pretty sexy anyways.

I've changed the files I've got available. I've seperated the program files from the data disk files so there are now three seperate files.

ahsp.zip is the Atari Hentai Strip Poker program disk. the Title Pic for this uses the default pallet you should use if you're going to create Hentai Strip Poker data disks. The only colour that can be radically altered without affecting the game sprites is the background colour.

add1.zip is my Sailor Mercury Hentai Strip Poker Data Disk (requires ahsp.zip to play).

vdd1.zip is my Velma Hentai Strip Poker Data Disk (requires ahsp.zip to play).

These are the URLs for the three disks.

http://www.hwcn.org/~ad329/ahsp.zip
http://www.hwcn.org/~ad329/add1.zip
http://www.hwcn.org/~ad329/vdd1.zip

I can only keep these files available for a short time as I don't have much webspace. If someone would like to create an official Atari Hentai Strip Poker webpage then please feel free to include all these files on it (and let me know).

269. New YM (atari ST) to VECTREX conversion program...

Newsgroup: comp.sys.atari.st
Date: 1999-06-06 00:00:00 UTC
From: baronvr <baronvr@my-deja.com>
Message-ID: <7jdo2c$t4q$1@nnrp1.deja.com>
Source record: 77635

I've just posted a new program by Chris Salomon that takes YM files (I have links to lots of em) and converts them into Vectrex binary images. This also means if you know how to make YM files (with maybe the Atari ST emulator) then you can compose complex music for your Vectrex or emulator.

Also, If you can put together a multicart, then you can turn your Vectrex into a jukebox. It's an exciting trend, I think, allowing people to make their own binaries to their heart's content...maybe someday a program will help people make their own GAME binaries...

Get the program at:

270. In Holland: For Sale Atari 1040ST + extras

Newsgroup: comp.sys.atari.st
Date: 1999-06-06 00:00:00 UTC
From: atarisale@troi.com
Message-ID: <atarisale-0606991503070001@192.168.1.9>
Source record: 77636

Hi,

This is for sale in Alphen a/d Rijn (Zuid Holland), the Netherlands

1x Atari 1040 ST with 1 meg ram
1x Atari Monitor Monochrome
1x extra floppy drive 3.5 in, for atari
1x impact Printer from ALL AR 30
1/2 pack of chain paper for the printer
Includes floppys with all the software i worked with then.

All in one sale for fl 100,--. (about $50). You have to come and get it
here. No shipping.

I stopped working with it a few years back (1994?), when we switched to
developing on Mac. All is still in good order but maybe a bit dusty.

I don't watch this list very often, so please email me if you are interested:
<mailto:atarisale@troi.com>

Have Fun!
Peter

> installed upside down or something like that?

Resistors can be soldered in any way, best with signs upside ;-)

Use it only for the point as describe in the manual.
Clean up solder pads on mainboard with a smal solder iron
before soldering resistor. Itï¿½s a smal part. Hold it with
an smal screw driver, any kind of smal clamps, on his place
and solder it quick. Use the solder iron so that you touch
the solder pad AND the resistor at the same time. Needs only
a very smal part of solder.

> What is the best type of Memory to use on the CT2B?
>
> I have a 16meg 72pin Simm that I use in my Falcon
> with a Ram Karte memory board. Will this Simm work
> correctly as Fast Ram in the CT2B?

Check it out at 800x600x265. Flickering vertical stripes
tellï¿½s that you canï¿½t.. (I hope not, check it..)
For the CT2 an EDO is needet. Got best results with 8 Chip modules.
Other as EDO doasnï¿½t work.

> Also, any known problems with after market memory
> upgrade boards with the CT2B such as the Ram Karte
> or the Ram Gizzmo?

Yes. Some orignal 4/14MB memory boards doasnï¿½t work well.
Stripes as described upper..
FalconWings -> doasnï¿½t work
14MB Board form WB-Systemtechnik -> works, but not all!
(Itï¿½s a problem with the used PS2 Simm, i think so)

Best results: CENTRam

> Must one install a FPU in order to use the CT2B?

CT2, same as falcon, works without any FPU.
You can insert FPU later. Hardware detect the FPU automatically.

Do no NOT use 16Mhz types of the 68002 FPU.
You MUST have a 33Mhz type.

While insert FPU, marked point on chip in direction to the
CT2 CPU. Point is marked od the board (Rev. A)

> I notice in the documentation that a modification
> to the Falcons VGA adapter may be needed for
> extended resolutions with non multi-sync monitors.
> I have a 17inch SVGA that I am using with the
> ScreenBlaster II external hardware and software.

Yes, modification is needet to use the video clock that comes
from CT2 board. Iï¿½m sure you doasnï¿½t need your SB again :)
Same as here..

> Can I still use the ScreenBlaster II hardware/software?
> If so, does the ScreenBlaster II hardware fix the bug
> with the VGA adapter that the documentation mentions?

Not tested. SB external delivers also a video clock on the
same pin as CT2. I think that doasnï¿½t work. I you use the
video adaptor as described in CT2 manual, an external SB
canï¿½t deliver his clock to falconï¿½s videl chip.

With the software iï¿½m not sure, also not tested here..
CT2 with Centscreed makes what i want. 928x608x256 as
standard display on an multisync. Higher resolutions also
work nice. Doasnï¿½t need any other hard and software too.

> Any additional info about the VGA modification and
> what kind of extened video modes will not be
> obtainable if this modification isn't done would
> be helpful.

Hm, iï¿½m not realy sure what you mean?
Display works in the same was as before, without CT2, adaptor..
Monocrome up to VGA. If you like to use an r,g,b display, use
the right monitor adaptor -after- the CT2 adaptor.
Colorised schematic of the CT2 video adaptor -> DOITF030

> Someone told me awhile back that there was problems
> with doing MIDI stuff with the CT2B.
> This may only be a rumor.
> Are there any know problems with MIDI?

Sorry, must quit that part, no midi connections here.

> When doing the CT2 wire soldering there is
> a part where you have to remove the chip at
> U44. Is it really necessary to break pin 15
> of that chip and use it in the socket?

Why? Sure, you can do that, but you canï¿½t replace the
chip a original if one pin is lost. Bent this pin up.
Itï¿½s enough. I build an pin with wire and solder, works
fine from the first day forwards to this message here..

I used a smal pice of glue to fit the wire so that the
pin canï¿½t disconnect. Wire should not get in contact
with the pin you bent up before, insulate it. (Tape)

> Or can one use a pin from a different chip
> or maybe a componet leg like from a resistor?
> I don't want to destroy this chip unless I have to.

Yes, what i mean upper :-) Works fine.

> And, I'd like to get a few extra Inductors that
> are exactly like the one at L102 on the Falcon
> Mother Board. Anyone know the technical info
> on that inductor at L102?

Must have a look to the part list in manual, but i think
itï¿½s a wire, like a resistor leg, with a ferrit tube outside.

Regards, Robert

Hi

Yep they were took over, I can't remember the company at present.

As I use 135meg cartridges I can't comment on the 230meg ones. Maybe
they used more than one disk layer/heads!

As the removable cartridges are in respect are the same as normal hard
drive, they are liable to the same problems when it comes head crashes,
I take more precautions that I would with hard drives in general.

Hard drive media is sealed in ultra clean environment (vacuum), the
cartridges can't. They are obviously venerable against dust, as well of
the magnetic side of things, and dropping one can damage their health.

I try and treat the cartridges very carefully, when not in use they are
in their cases and placed in a draw to avoid dust being blown onto them
via normal drafts etc. As mine usually contain back-up, I also try and
keep them away from the masters.

I have been using the majority of the cartridges for transferring my pd
library disks over to the pc for slapping on a CD. It takes ages dealing
with 135meg max a time, and then Windoze is fussy on filenames!!

> Could anyone tell me whats the best software/ package for ie.
> an organiser/ diary/ diary est. + what`s the latest version of
> `Auto Route` or any other route finder.

Hi

Harlekin has a diary/organiser feature on it, along with other things, and it's also an accessory.

I use the program all the time and ST Review had 2 versions on a cover disk;)

I know there are others around, it's just finding them.

AA Autoroute, I think they only did one version. There is a program called Routefinder of which you can update/add roads yourself, this is shareware and has a 50 mile journey limit on it which is removed when you register.

->I now have a STinG setup accessing my Freeserve and Zetnet accounts
->fairly reliably at full speed under single TOS on my Falcon - thanks
->to everyone for their help :-)

Congratulations! ;-)

->Now, I got MultiTOS free with my Falcon, and I'd like to try out
->things like aFTP and embedding OLGA-aware apps like AniPlayer in CAB,
->so how do I set up STinG to work with MultiTOS?

Just my 2 cents worth, but dump Multitos and grab the latest FreeMiNT
kernel. Its not buggy like the Multitos AES, is much faster, and is
well supported. It will work just like MultiTOS only better.

->I've tried seemingly every order of DRVIN, SCC, MINTNP and STING in my
->AUTO folder, but either the STING DIALER connects okay and whenever I
->try and access the net there is a bus error (e.g. using Ping, Newsie,
->etc), the DIALER doesn't dial in at all, or it dials in at 19kbps
->instead of 115kbps and still generates a bus error when the net is
->accessed.

Which version of Multitos do you have? The older version does work
with STing, I actually had it setup once. However, the newer version
of MultiTOS does not work with STing. I gave up on it.

->I am using MultiTOS AES 4.0 and it is launched from my MiNT .CNF with
->the line:
->
->GEM=C:\MULTITOS\GEM.SYS
->
->and Thing is set up as an AV server and font selector.

Thing is awesome, get the FreeMiNT kernel, set them up to work
together and you will have an inspiring combination. ;-)

->I am generally a bit confused by MultiTOS, so any advice would be
->appreciated :-)

Can't say it enough <big grin>, dump MultiTOS, grab FreeMiNT and
use it with Thing...

Bonjour,

Dans son message ï¿½ï¿½Re: Dungeon Master Nexusï¿½ï¿½, DarkChyld a ï¿½critï¿½:

ï¿½ï¿½ <big grin> Seriously, I just get a kick out of watching people
ï¿½ï¿½ play and enjoy Atari games...Hmm...wonder if we could get enough
ï¿½ï¿½ people interested in a group re-play of DM and CSB? Just a small
ï¿½ï¿½ thought, especially since both games run on all TOS machines up
ï¿½ï¿½ to the Falcon...Don't know about the Hades/Milan? Any of the
ï¿½ï¿½ owners of those machines tried DM/CSB? Thanks! ;-)

It's the first game I tested on Hades. Unfortunatly, it doesn't seem
to work :-(:-(I think it's because there is no "320*200*16" graphic mode. I
suppose it could be emulated, but I know nothing about that. If something
could make it and then allow us to play DM on Hades, it would be excellent...

Did you know that the source to GEM has been released?
At this point, porting the gemdos calls and the vdi to
Linux might be the most sensible thing to do. Then you
could just use Linux drivers for the low level device
support...

Gotta pointer? Lean apps seem to be a dying breen everywhere
these days. The ability to run GEM source on top of svgalib,
sdl or X could be quite handy...

284. TAF Meeting June 16th - Mario Becroft's Marvels!

Newsgroup: comp.sys.atari.st
Date: 1999-06-07 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <375bede0@nemo.idirect.com>
Source record: 77500

Agenda for the June 16th, 1999 meeting of the Toronto Atari Federation:

As your classic Atari ST/TT/Falcon gets older, you may find that certain parts of your system may need replacing. Is your mouse getting tired? Has your mono monitor faded to black? Has your SH hard drive spun down for the last time? Where am I going to find replacements?

At this particular meeting you'll find the perfect solution to these questions, as we'll be showing off and doing demoes of three products done by the young New Zealand genius Mario Becroft that solves these problems nicely!

Astound! at the sight of attaching a PC three-button mouse to your ST via the Mouse Adaptor and make it perform double-clicks with one click of the central button! (Also makes a great gift for Amiga users!) Thrill! at getting a nice clear SVGA monitor screen via the VGA Adaptor - mere plug & play! AND! Prepare for the biggest surprise as we show you how to put a notebook IDE drive INSIDE your ST/STe's case via the new IDE Adaptor (which also opens some interesting possibilities - how about putting an iMation SuperDrive inside your ST for starters?)

If you've been worried about replacing mice, monitors or hard drives, this meeting is a MUST-ATTEND spectacle of technological marvel! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Ken MacDonald, president: anarkist@idirect.com, 416-533-0504

Source record: 77501

TPUG AND TAF JOIN FORCES FOR A DAY OF EXCITING BARGAINS IN TORONTO!

The Toronto Pet Users Group (THE support group for users of Commodore's PET, VIC 10/20, 64 and 128, and the Amiga) and Toronto Atari Federation (North America's largest user group for the Atari enthusiast) are holding a joint Flea Market at the Alderwood United Church, 44 Delma Drive in Toronto, Ontario, Canada on Saturday June 19th from 11:00 a.m. until 3:00 p.m. If you own any of these classic computer systems and have been looking for hardware or software, or you have systems or software that you'd like to sell, now's your chance. Sell your old stuff, go home with a treasure!

The days of rivalry between the two competing systems are over, and users of both these platforms realize that it is better to cooperate rather than to butt heads. And indeed, with the Amiga's strengths in audio and graphics, and the ST/TT/Falcon's strengths in MIDI and DTP (not to mention the fact that both platforms make excellent and cheap machines for getting on and making use of the Internet) there is much that can be learned and shared between the two platforms by their respective users.

TAF will be there with copies of ST+ Fanzine for sale and with a number of Mario Becroft's excellent new products for adapting PC serial mice, VGA/SVGA adaptors and internal IDE drives to Atari STs (the Mouse Adaptor also works with the Amiga, so if you've got an Amiga with a dying mouse here's your chance to use one of the many excellent two and three-button mice available to the PC with your system), as well as info on how to join TAF.

It's going to be an exciting summer - and this will be the event to kick it off! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. > goes into a rebooting loop. Is this because a program in the AUTO
> directory is duff?

it doesn't sound promising!

> If so, is there a way to boot it without running any programs (like
> holding the <Shift> key
> down in windows), or forcing the machine to boot from floppy?

There is depending what hard disk driver you're using.

You can always boot from floppy restructure your AUTO folder and try
again.

If you haven't got a boot manager, e.g. Superboot, Xboot etc, then this
could be time to start and use one. It makes finding rogue auto folder
programs a doddle;)

>>software, as ICD used their own scheme for extra partitions. This may be
>>important if/when you decide to switch to using HDDriver in the future.
>
>Do these rules apply under normal TOS?

No I don't think so - I have a drive partitioned with ICD to 7 parts and containing an ICD driver for use on my STFM; when I connect it to the Falcon's SCSI bus, where the Falcon boots from HDDRIVER on its internal 4-partition IDE, it has no problems recognising all 7 external partitions - plus three more on an EZ135.

The one advantage of the ICD Pro software is that you get an extra program that allows you to move around the order of the partitions, even between drives. With HDDRIVER you can only move the order of the devices but not partitions between drives. I asked Uwe if he couldn't implement this, but he said I was the only one who'd ever asked for it, so no go!

It may seem a strange thing to do, but in my case it should allow me to have two independent C: drives, each with their appropriate boot managers (XBoot and Stoop), AUTOs and ACCs - one for the STFM which boots from the external drive and one for the Falcon which boots from the internal IDE. By arranging the order of drives so that my old D: to I: come straight after C: on the IDE but before the rest of its partitions when using the Falcon, I should be able to retain the same paths and env variables in many of my programs. I haven't tried it yet - and this does assume that the new partition info is written to the driver on the booting disk and not on the disk partition lead-ins - otherwise one couldn't have two different drive-letter orders. We'll see!

Of course, it might be simpler to just buy a bigger internal IDE than the present 82 MB and transfer everything to that! :-)

Regards, /Peter/

It's not nececssary to run it from mint.cnf when you have a MultiTOS-aware
MiNT-kernel. E.g. the following...

```
xboot.prg
drvin.prg
scc.prg
ffsel.prg
nvdi.prg
metados.prg
mint.prg
sting.prg
videlity.prg
```

...is perfectly legal, MiNT will run sting and videlity.

Just as under TOS. Just make sure that HS-Modem runs before MiNT, and STiNG after. It's also likely that STiNG does not work with memory-protection, so make sure MP is disabled (rename mint.prg to mintnp.prg). And download the latest MiNT-version, the current version is 1.15.1.

> I am using MultiTOS AES 4.0 and it is launched from my MiNT .CNF with
^^^^^^^^^^^^^^^^
Do yourself a favour and get N.AES or Geneva instead ;-) The original MultiTOS is *extremely* slow, it's practically unusable on a standard Falcon.

From: Technoid Mutant <Technoid@cheta.net>
Message-ID: <375C1ABF.BCA44CA1@cheta.net>
Source record: 77509

I have mint 1.4.1 up and running on my 256mb "E" partition - part #3. Everything boots and runs fine except that my font is unreadable on my color monitor.

Do I need a mono monitor to run this version of MiNT? I don't have a mono monitor. I plan to make a VGA cheater cable for just this purpose but had not done so yet.

I can navigate the file system and startx runs, tries but dies to a prompts. I would like to be able to see what I am doing.... How do I fix it or change the codepage to something else?

Thanks for all of your help folks

In that case you probably need to ensure that no screen savers are enabled,
too: they seem to be quite good at causing problems.

:-)

>Last week I had one 8 megger, installed Win-95, had it restart and it took

>came out? 4 megs needed, weren't they?

I think it was 8, but 16 recommended. 32 is about right for a minimum... I
have 64 and the thing keeps stopping to play with its hard drive with
depressing regularity...

Things are even funnier with NT: M$ say minimum is a fast 486 with 16Mb RAM.
Our systems guys at work are now recommending nothing slower than a P200 and
no less than 64Mb of RAM if you want to stay sane.

Ok, it's done ;)
I suppose it's not a big problem (but it seems very surprising !)

304. Re: MultiTOS & STinG

Newsgroup: comp.sys.atari.st

Er, but FreeMiNT doesn't multitask GEM programs like MultiTOS does.
AFAIK, FreeMiNT is a replacement for the MiNT part of MultiTOS, not
MultiTOS itself.

> Which version of Multitos do you have? The older version does work
> with STing, I actually had it setup once. However, the newer version
> of MultiTOS does not work with STing. I gave up on it.

The 'official' AES 4.0 version - i.e. the one that _should_ work with
STinG!

> Can't say it enough <big grin>, dump MultiTOS, grab FreeMiNT and
> use it with Thing...

But as mentioned above, AFAIK I won't be able to multitaks GEM
programs and use OLGA :-(

I downloaded FreeMiNT 1.15.1 and it does look good, and preliminary
trials (using FreeMiNT instead of MiNT under MultiTOS) have resulted
in much confusion (half my software won't run at all or find its
resourve files!), and when I finally bodged up some sort of fix to
that problem, I found I could dial in an use the STinG's tools :-)
Only problem is that CAB causes a bus error immediately when trying to
resolve, and Newsie crashes out with the same error after leaving the
server after checking for mail :-(

Any ideas? It could be something in the MINT.CNF as this new FreeMiNt
one has a lot more stuff in it I don't understand than my old one ;-)

>Falcon.

I am _very_ aware of how slow it is :-(Unfortunately I am rather
poor and can't afford Geneva or N.AES, and AFAIK there isn't an
English language release of the latter yet. Konstantin Woller says it
is in the pipeline though. So I struggle on with MultiTOS (or I would
if I could get it to work properly!)...

As for FreeMiNT 1.15.1, well I have sort of got it working with
MultiTOS, and although I can get STinG's tools to work, niether CAN or
Newsie works properly :-(

|Pardon me for being as thick as dog waste, but what the hell are
|these for?.

Steve,

These will enable you or I to actually run a web server with a minimum of hassle right from our Atari 'puters.

The way it works is that people access your server via EZ-IP, which re-directs them to your IP number. The problem has been that most of us have dynamic IP numbers rather than static.

When you run the first client, you are telling EZ-IP what your IP number is for the current session. EZ-IP then can re-direct visitors to your server quickly and easily. Of course, you need to set up a subdomain with EZ-IP first, but that's pretty easy from what I've heard.

From what I understand, you don't really need these clients, as you can tell EZ-IP what your IP number is 'manually'. But this makes it automatic.

The other client, I believe, is to tell EZ-IP that your server is no longer connected.

Using Oliver Booklage's <sp?> web server, you can actually run your own server and make it easy for people to get there by using an EZ-IP URL...

I'm sure that either Ronald Andersson or Rob Mahlert will fill in the gaping holes I've left in the process, but that's the gist of it.

Oh, and by the way... if THAT was dog waste, I've stepped in MUCH larger piles than that, so don't worry about it. <G>

Hi!

In article <7jee01pfe2@news.campuscwix.net>,
darkchyld@pcc-uky.campuscwix.net (DarkChyld) writes:
> Hmm...so the double ampersand is okay?

Yes, it's an "AND" operator with shortcut functionality as in C, i.e.
the second part will only be executed when the first part was
successful (return code 0).

Thus, something like

```
test -x /bin/ls && /bin/ls
```

will first test whether /bin/ls is an executable file, and run /bin/ls
only when this test was positive.

The same works with || for "OR", in which case the second part will only
execute when the first failed.

Of course, it's also possible to use more than one of these operators in
one line, as in

```
test -x /bin/ls && /bin/ls && echo Directory listing successfull
```

You'll agree that this is shorter and more elegant than

```
if test -x /bin/ls
then
if /bin/ls
then
echo Directory listing successfull
fi
fi
```

Ciao

Thomas

both the TT and the Falcon won't have any problems (to be more precise, up to the year 2107), for the STs it depends on their real time clock.

There are (free) programs on distribution to check that.

Peter

Source record: 77563

Hey everyone. I purchased this ST setup a while ago hoping it'd get some good use out of me... man, was I mistaken. The most I got done with it was replacing the broken floppy drive. 8*) Anyway, here's the basic run-down, e-mail me for specifics:

Atari ST 540 main unit
SC 1224 color moniter
Color printer (with parallel cable)
Working mouse (original, great working condition)
Bunch of software
Standard Atari 2600 joystick (works with ST)

STs are great computers and still supported to this day! From what I hear they're great for MIDI sequencing, and a lot of people go on the 'net from their STs and everything.

First $75 and shipping gets it (or if you wanna pick it up, minus shipping). First $100 and shipping (or if you wanna pick it up, minus shipping) gets an external HD and external CD-ROM with it (don't know size or speed, GUESSING 540M and 2x). I don't think they're specificly for the ST, but they were in there when I got the setup, so I'm guessing (GUESSING!!!) they were used in conjunction with the ST (cables weren't and aren't included). If you buy the HD and CD-ROM and they don't work with the ST, then it's TS. 8*) I take NO responsiblity if they don't work with it, don't come crying to me if they don't work with it.

Shipping for this puppy is gonna be a lot, it weighs a ton (not literally). It'll be sent UPS 'cause I don't think the USPS will take something this big. If you're interested, e-mail me at legacy6150@aol.com Thanks.

316. Falcon Hard Drive help

Newsgroup: comp.sys.atari.st
Date: 1999-06-07 00:00:00 UTC
From: puffpuffin@aol.comREMOVE
Message-ID: <19990607005415.26419.00002619@ng-ch1.aol.com>
Source record: 77567

I am in a strange situation with HD Driver 7.55 on my Falcon.
Everything was working fine with my IDE drive until I tried
repartitioning it.

I repartitioned my 1.4MB Seagate Marathon IDE drive in my Falcon to 5
partitions which proceeded fine. However, when I exited HDDUTIL, the
Falcon would not recognize my IDE partitions. So I resetted the
machine, but now the IDE drive is not recognized. I tried running
HDDRIVER.PRG, but it still refused to recognize my IDE drive. I
tried this several times, but no go.

I then loaded up HDDUTIL again. It refused to install HDDRIVER.SYS on
my IDE drive, and it still would not recognize the drive. However, I
did check the "IDE Drives" menu option, and it read the correct number
of cylinders, heads and sectors and IDE 0. I tried installing
HDDRIVER again, but it still wouldn't recognize the drive.

I then tried AHDI 6.05c, and this time it worked! The IDE drive and
the new partitions were recognized. I installed the autoboot with
HINSTALL and all was fine again. I did try to install HD Driver again,
but it still refused to recognize my IDE drive even though AHDI does.
Frustrated, I gave up on HD Driver.

However, I decided to repartition the drive again, so I loaded up
HDX 5.03c and tried repartitioning it. It choked. It looked like it
got stuck on a bad sector from what I could tell by looking at the busy
light. I know it does not take 30 minutes to partition a drive!
I tried partitioning again, but now HDX says to format the drive.
I cancelled, but now, neither HDDRIVER nor AHDI recognize the
partitions anymore! However, AHDI still recognizes the drive, but it's
useless without partitions.

So before I format, anyone have any ideas on why HD Driver won't
recognize my drive and what should I do? I'd appreciate it.
I miss my working Falcon. :(

Thanks, Phil

1st Word .doc files can't be read directly by a PC.

Intead of getting a 3rd party ST, why not run 1st Word on an emulator on
the PC, then convert them to .txt files ?

> 2. Can anyone recommend a reliable repair centre in the UK (preferably

Anyone who can handle a screwdriver and a soldering iron can. There are
instructions in the Quick FAQ.

Yes but the three of them have kinda different approaches; The Hades tries to be Atari compatible with high-quality components, the Milan tries to be mostly softwarematically Atari compatible with cheaper off-the-shelf electronics and slightly PC-oriented build (fortunately without the crappy bios and processor that come with PCs) :) and the Phenix is muddling somewhere between Atari legacy and being something completely new. And since Centek does not want to see the Phenix as an Atari clone, I doubt they would want to join the Milan and Hades in a standard.

Buy ? This is out of the "ready-made-cable" league.

You'll have to find the pinouts of both types of connectors and build
the adapter yourself, or get it built by someone who can solder.

In addition to that, the number of computers originally sold doesn't say much about the number still being actively used and of course the number of people who want a Centurbo for their system. :) For a start, I'd think the animo for spending a lot of money on accelerating a Falcon is higher than for a TT, as a Falcon really has some annoying bottlenecks.

Maurits.

I guess they changed their mind since then because they were definitely considering making a TT centurbo for a while. This is not a rumour, Centek wrote postings about this themselves. And also later on that they cancelled the idea because of a lack of interest and because, again, they don't want to support old Ataris (in fact they're not too happy about supporting the Falcon either, it's all Phenix for them from now on).

Maurits.

Unless it's a Mega ST, it won't even have a real time clock, so unless
you bother setting the time each time you boot up it won't even know
what time it is, let alone the date! If it does have a clock, it will go
happily on ticking until 2028 or something.

As for the software, well, it depends. None of the software I use even
uses the internal date, but I guess any accounting or database stuff
might have the bug.

This is in the Quick FAQ by the way...

Check out Mario Becroft's internal IDE adapter. It's made for 2.5"
drives, but I guess you could use a 2.5" to 3.5" adapter as long as your
PSU can support the extra load.

Yep, and in addition to that, I read about those upgrades for the TT.
Too bad they planned it to sit in the TT-RAM board slot. Just spent 600
bucks on a new board with memory... OK, one can try to sell the board
again, but it's not my piece of cake. Apart from that, spending another
700 bucks on a piece of 10-years old hardware... Keyboard's gradually
degrading, the old 85 watt PSU will work for how long???, not to mention
other components :-)

Actually, I'm still betting on the 060 Phenix, with 2 CPU's that is.
2 IDE controllers, SCSI on board, DVD drive, DIMM sockets... It now all
depends on how Dolmen handles "TOS-software"... Probably have to get rid
of older stuff again, but if compatibility is OK on recent S/W my bets are
on this machine. Linux 060 is ready, I heard...

I know the feeling.

After one year of TT-RAM and hard-disk debuging, I finally got
it working, but even so, Wdialog refuses to co-exist peacefully
with HS-Modem (it works a bit better with Fast_Serial but still
needs a couple of reboots, the first time I start it).

It would be really nice if everything worked, so I could start
using my TT again, instead of waste time coping with various
TSRs conflicting with HS-modem, MiNT or Wdialog.

Anyhow, I'm still developping my NMD distribution and I have
a couple of nifty ideas about a MEGA-STE network spooler, but
even so....

Since MiNT, I have gotten used to the Unix thing, but fighting
constant hardware and OS problems is not my cup of tea, so I'm
already lurking on the SUN/SGI side of things.

Such is life under the SUN. ;-)

But the 060 is also a fairly old design, IMHO they should have gone for a G3 or something since they obviously don't care about compatibility anyway. An emulator would run 68k-binaries just as well and probably faster than the 060.

> 2 IDE controllers, SCSI on board, DVD drive, DIMM sockets... It now

I'm not too optimistic about this, I've received a couple of mails from Centek that revealed some incredibly poor knowledge of current operating-systems like MagiC or MiNT. Dolmen might be TOS-compatible, but that doesn't mean much today when everybody expect full support for MagiC and/or MiNT.

337. MultiTOS & STinG

Newsgroup: comp.sys.atari.st
Date: 1999-06-07 00:00:00 UTC
From: ashley.seabrook@zetnet.co.uk
Message-ID: <375bc6ef$0$9534@znews.zetnet.co.uk>
Source record: 77588

I now have a STinG setup accessing my Freeserve and Zetnet accounts fairly reliably at full speed under single TOS on my Falcon - thanks to everyone for their help :-)

Now, I got MultiTOS free with my Falcon, and I'd like to try out things like aFTP and embedding OLGA-aware apps like AniPlayer in CAB, so how do I set up STinG to work with MultiTOS?

I've tried seemingly every order of DRVIN, SCC, MINTNP and STING in my AUTO folder, but either the STING DIALER connects okay and whenever I try and access the net there is a bus error (e.g. using Ping, Newsie, etc), the DIALER doesn't dial in at all, or it dials in at 19kbps instead of 115kbps and still generates a bus error when the net is accessed.

I am using MultiTOS AES 4.0 and it is launched from my MiNT .CNF with the line:

GEM=C:\MULTITOS\GEM.SYS

and Thing is set up as an AV server and font selector.

I am generally a bit confused by MultiTOS, so any advice would be appreciated :-)

Thanks in advance,

Ashley

It sounds like it.

> If so, is there a way to boot it without running any programs (like
> holding the <Shift> key
> down in windows), or forcing the machine to boot from floppy?

Yes, like holding down either the CONTROL or the ALT key.
ALT will boot with only the floppy
CONTROL will boot with the HD, but will bypass any AUTO programs or ACCs

>

I seem to remember reading that STinG is compatible with MiNT, but it
has to run after MINT.PRG, so you'll have to put it as an exec in your
MINT.CNF and not in the AUTO folder.

MiNTNet is supposed to be the best TCP/IP stack for use with MiNT
though.

```
-> Okay, I'll try that...thanks! Hmm...so the double ampersand is okay?
->
-> Thanks again! ;-)

Hi Thomas. Okay, I removed the offending ampersand, and the script does
run okay now, with no errors. I'm still not sure if cron is working right
though. Where should the output go from this instruction? (it seemed to
run, but I got nothing on stdout or /dev/console):

# DO NOT EDIT THIS FILE - edit the master and reinstall.
# (/tmp/crontab.100 installed on Mon Jun 7 09:58:40 1999)
# (Cron version -- $Id: crontab.c,v 2.13 1994/01/17 03:20:37 vixie Exp $)
01 10 * * * * echo This is a test

I'm wondering where "This is a test" should go? I can't find it anywhere
except in a mail that the system sends to root. Odd, that... ;-)

The cron log in /var/cron seems to indicate it worked though:

CRON (06/07-09:55:06-52) STARTUP (fork ok)
root (06/07-09:57:40-100) BEGIN EDIT (root)
root (06/07-09:58:40-100) REPLACE (root)
root (06/07-09:58:40-100) END EDIT (root)
root (06/07-09:58:50-103) LIST (root)
root (06/07-09:59:00-52) RELOAD (tabs/root)
root (06/07-10:01:00-106) CMD (* echo This is a test)

This looks okay, right? Well, thanks for your help! ;-)

Hi Simon. It could be an AUTO folder program, ACC or CPX. (well, CPX's from my experience rarely do this, but sometimes cause a crash). Anyways, what hard disk driver software are you using? Most common seem to be HDDriver and ICD's HD Utils. There is also CBHD (sp?). Anyways, with most of them, you can hold down to get to a desktop with no AUTO folder or ACC programs loaded. will force a bootup from a floppy disk with ICD's software. If you have the docs to your software, read into it a bit. It will usually tell you how to bypass everything. Good luck!

Is there a program to convert LZH files to regular ZIP so STZIP can handle them. I can't get DCSEA to unpack the archive no matter what I try so I've given up on it but I can't find any other programs to handle LZH files. Is LZH that rare that no other programs exist for it?

I need HSMODA07.LZH in regular ZIP format.

Thanks...

You need LHArc to extract LZH-files, should be found on most ftp
servers.

If anyone could help me with this project please email me.

This is what I wish to do.

I currently have a windows98 network setup.

I want to attach the falcon030 and megaste to the network,
install Linux on the megaste, and use it as a internet
proxy, web server, mail server, and news server.

now the problem I have is I heard back about 5 years ago
about some people networking thier falcons and ste's to a
tcpip network, but I have no idea how to get the hardware
for this.

If you could help that would be great.

Michael

> A while back a remember finding a Web Page that had lots of
> diagrams and etc for making your own computer related cables.

Try this one:

http://www.hwb.acc.umu.se/

Any special cable in mind?

For the Atari ST/STE/TT/Falcon most cables are pretty straightforward and
the same as for PC:s or Mac:s.

These cables can (and should) be bought from any well sorted computer store:

MIDI
Printer
Serial to modem, various 25p and 9p combinations
Serial to printer (different from the serial to modem)
Serial to serial (null-modem)
LAN (round) to modem (same as Mac to modem)
SCSI on TT (D-sub 25) to various connectors on peripherals
SCSI on Falcon to various connectors on peripherals
Adapter from 25p to 9p serial (if you want to use a PC mouse on your modem
port)

The DMA cable is usually DIY, but it's straightforward.
The internal flat ribbon cabling is also stock:

Floppy, SCSI, IDE

A couple of cables have been impossible to find, although it doesn't mean
they don't exist:

IDE 44p hi density (for 2.5" drives, as in the Falcon) to standard 40p IDE.
I've made a couple of these.

SCSI 50p (internal flat ribbon) to ??p SCSI for 2.5" drives.

There are also very special cables, like the Blitz copier which uses both
the printer port and the external floppy port at the same time. This one you
have to make yourself.

The connection that is most unlikely to be found in shops is the one between
the computer and various monitors. Here there are l-o-t-s of combinations!

Here you'd need to know what type of monitor you're dealing with and where
it expects the signals.

An EGA monitor can normally not be connected to any Atari. However, if it amuses you, there are schematics for building adaptor circuitry...

Te SM124 can be connected to the Falcon and some Mac:s but not to a TT. In some very special cases you can make it work with a PC graphics card. But why should you? It would be really pointless.

There are various adaptors for Falcon to monitor. Normally you'd have to make your own here too. Only thing I haven't tried yet is Falcon to MacIntosh monitor. Anyone else?

The Amiga mouse can be easily converted to work with Atari and vice versa.

Hi,

errrmm,
can I get it in QRM format please....??????

Hate to say this, but I also hate people who run systems without the basic stuff needed to run it.

We had this discussion before, but an Atarian running without ZIP, ARC, LZH and ZOO archivers isn't going the right way... like driving a car without a steering wheel.

They are all available, so is 2IN1 (free now!), so why not waste two minutes D/L time and 2 minutes more on configuring and you're out of problems.

Reason why I put this stuff on my mini-BBS as well, mostly TOS versions and the others in ZIP. Even a ZIP2TOS program available....

What more do you want? Ready-to-use prg files???????

Hi, all.

I have, as stated in previouse posts, got myself a CornerStone Dualpage 19" b/w monitor. I would like to be able to use this monitor on my TT, but I have no info on what the TT's ECL signals are like. The DualPage model is M/10720, and it is basically the same as model 120. This is the info I have about the DualPage.

Cornerstone DualPage 120 Display Specifications

Resolution: 1600 (H) x 1280 (V) pixels
Display Size: 19" diagonal
Screen Area: 13.8" (H) x 10.8" (V)
(353 mm x 262 mm)

Video
Bandwidth: 262 MHz

Horizontal Scan
Frequency: 105 Khz

Refresh Rate: 76 Hz

Scanning: Non-interlaced

Phosphor
Type: P-104

Video Signal: 10K differential ECL
Overscanning: User selectable

I have tried posting for info on this before, without luck. So, I try again, now with more info on the subject ;-)

What I have to know, before contacting CornerStone tech-support, is the ECL signals the TT use, and what other signals are involved when using a big-screen in TT-high res. So, if noone knows if I can connect this one somehow, I need at least more detailed info about the TT's ECL signals than just "TT uses ECL..". Anyone?

HD-Driver recognises the Link2, you can get a copy from Core Designs (used
to be Titan, but they changed their name cos there's a big PC vendor called
Titan)...

Hello Johan.

To begin with let me clear up a misunderstanding on my part:

I had believed that fVDI was intended to fulfill exactly the same purposes
as NVDI does, thus fully replacing that system enhancement. Evidently that
was not your intention, so some of my conclusions were unwarranted. This
means that in some cases where I have urged you to attempt using methods
more compatible with those of NVDI, it might be more appropriate instead to
try to use methods that let both fVDI and NVDI work together.

on Fri 04-06-1999 12:39 Johan Klockars wrote:
>In article <3756572c2be8921@oden.se>, Ronald Andersson <dlanor@oden.se> wrote:

>reason for being there.

True, but if that dispatcher is to be reachable through the 'subroutine'
driver, then it should also have linked itself into that driver, and then
any subsequent driver should also hook into it through XBRA protocol.

>>This should mean that the required 'behaviour' of loaded drivers

>Anyway, I don't think they're compatible with the old GDOS ones.

Perhaps not the screen drivers, but I do know that some very old printer
drivers have worked well with NVDI, indicating that these at least do have
compatible interfaces. Whether or not that compatibility also covers the
screen drivers or not depends much on how 'symmetrical' NVDI is in how it
implements drivers in general.

>>before AMC_GDOS was loaded. This means that the subroutine was not
>>intended to lead to a fullfledged VDI but only to a fairly simple
>>screen driver, not implementing any of the GDOS functions itself.

>
>Well, fVDI (like NVDI as far as I know) is an 'integrated' driver in
>the sense that there is no separate GDOS. Thus, there is only one
>dispatcher.

But then that must mean that it also needs to be compatible with some
GDOS loaded 'on top' of it (by later \AUTO\ program I mean). And so,
fVDI must not report any GDOS at all as being present (XGEM -2), as
doing so would lead to other GDOS versions refusing to load.

>So far there are no printer drivers etc for fVDI so I'm not sure
>what would be required for those (but I'm reasonably sure that I've
>not done anything that would make them more difficult to write).

If fVDI is to implement them ast all, then they must of course be
implemented fully compatibly with existing implementations. What
we need least of all right now is further divergence in standards.

>>If this is true, many speedup possibilities exist for your driver, as
>>that does not seem to be implemented so, but rather as an alternative

>Also, in the case of NVDI without drivers of its own, the background
>VDI will actually have to deal with everything except the vst_/vqt_
>calls and v_gtext/ftext/justified (and perhaps a few other things).

You are probably right. I have not 'dug deeply' at all into how NVDI
implements its loadable drivers (yet).

>>construction of alternative screen drivers that should be compatible
>>with any Atari compliant GDOS. And that should (hopefully) include
>>NVDI too.
>
>I don't think NVDI's drivers are compatible with the other GDOSes.

Perhaps the screen drivers are not, but some printer drivers definitely are
compatible to NVDI, despite being written for much older GDOS versions.

It could be a 'dual interface' solution, using one type of interface
for drivers recognized as NVDI-aware, but the older interface for any
drivers not so recognized. (Just an idea.)

>A 'screen driver' in the form of a background VDI really has to be
>able to do just about everything (as described above).

Ok, if you say so. I have not studied this deeply yet, so many of my
conclusions may be incorrect of course, based on insufficient information.

>In the case of fVDI, there's should really be no need to be compatible
>with anyone else, since you could do one of the following things:
>- Use fVDI as a background VDI.
> The 'front' VDI would then take care of all non-screen devices
> completely and pass most screen things through to fVDI (with text
> output converted to vrt_cpyfm).

I see. That should then allow NVDI to work as 'front VDI' for fVDI as
'background VDI'. Correct ?

>- Use fVDI as a front VDI.
> fVDI will now deal directly will all devices it has drivers for
> (currently only the screen). You can, however, set it up to pass
> all operations on specific other handles (including the workstation
> open/close calls, of course) through to the next VDI, and thus
> still 'support' all hardware that VDI knows about.

Here I do not understand you completely. There are of course different
types of handles involved, for physical and for virtual workstations.
The latter can not possibly be known at configuration time, so you must
be referring to the physical workstation handles. Correct ?

Here you seem to imply that we can also use NVDI as 'background VDI' with
fVDI as 'front VDI'. Correct ?

One problem with this could be the special way in which NVDI manipulates
XBRA chains so as to keep itself 'on top'. I have had to 'work around'
that problem in some XGEM enhancers of my own. I'm not sure if that
problem extends also to the VDI driver subroutine though, as none of my
XGEM patchers need to interfere with that.

>In the first case screen operations will be slowed down a bit, but
>you'll have access to all the font support etc of NVDI for example.

>with the fVDI font support for the screen, though.
>(In the future I intend to make it possible to use the background VDI
> to draw text into a monochrome buffer which can then be blitted by fVDI.)

In both cases above, the slowdown effect can be kept to a minimum by
using table driven function access internally.

>>I hope you implemented XBRA for this vector too, for it is a system
>>vector, even though it has no specific storage address. Anyone who
>>modifies any system vector must use XBRA, in this case as in others.
>
>I never thought about it, but I could of course do that.
>It's a bit risky, though, since nothing would work if fVDI was bypassed.

The same could be said about any XBRA usage for any vector at all, but
it is really not relevant. The main purpose of XBRA links is not to allow
any active driver to be bypassed, even though it is possible to use them
to do so. The main purpose is to support a multi-level enhancement chain,
so that any enhancement can 'disconnect' itself even if other enhancers
have linked itself into the chain later. That is the unique capability
of XBRA protocol, that is lost with all simpler vector bending.

It does not matter if your own enhancer does not 'want' this ability, as
you too must use XBRA if any other enhancer is to have that ability. That
is why Atari themselves raised use of XBRA for all vector bending to be a
required standard for all vector benders.

Use of XBRA is thus not optional, but absolutely mandatory.

----- snip ----- re: delegating work to older VDI

That may be so, but I wonder if it will really be practical to use one
and the same binary for so wildly different systems.

----- snip ----- re: fVDI standards not yet firmly decided
>

>>scant info already available, I believe it should be possible to achieve
>>sufficient compatibility to make drivers mutually exchangeable.
>
>I actually don't think there's much chance of that, but as described
>above, it shouldn't really be necessary.

You a probably right. My comment was based on the assumption that fVDI
itself would be both a screen driver and a full GDOS replacement. If it
is actually intended for use together with some GDOS, such as NVDI, then
there is actually no need for fVDI to use similar methods. In fact there
is even a contrary need, to not use the same methods, as only one GDOS at
a time can be permitted to interpret ASSIGN.SYS etc.

>>What we need today is not more separate formats for such things, but more
>>ways for related things to share common formats. If the standard for a
>>loadable driver is indeed simply to support standard VDI operations in
>>the same way that the TOS VDI subroutine does, and possibly even delegate
>>some work to that routine, then such compatibility should be achievable.
>
>That is not the way fVDI drivers are used at all, and at least the NVDI
>screen drivers are also very different.

Ok, I've got it now. This mistake was also due to the same reasons stated
at the top of this mail.

>The fVDI drivers are in essence similar to the LineA functions. That is,
>a selection of primitive operations that can be used to implement more
>general ones. It is possible for a driver to replace a complete VDI
>function (only for operations on that device of course) as well, though,
>if necessary.

I think that this will indeed be necessary for lots of functions, to gain
acceptable efficiency.

>A basic fVDI driver would only contain pixel set/get routines and some
>setup stuff. The main fVDI engine can then use those to perform any kind
>of graphics operation (very slowly, naturally).

Slow indeed ! That would incur a horrible overhead for breaking down more
complex operations into single-pixel operations. I'd estimate that over
90% of the work done would consist of such conversions alone... Surely
any serious driver would have to implement much more than this.

>Various 'optimizations' are done by fVDI, such as using the mono-expand
>routine for text output if a driver has the former but not the latter,
>or using line drawing for solid fills if there's no fill routine.

Ok. Such implementation details are bound to differ anyway.

3-4 big fans, placed optimally to cool those 21 boards, will probably have
more cooling effect than the tiny 1W fan mounted on the CPU by Centek.

>-|<|------+
> on D9 1N914
> mother Falcon's card

That method does seem a bit risky to me, but I leave that to your own
judgement.

Now for some radical news !

During my many experiments I have repeatedly measured the PSU voltages of
my Falcon. Recently when I did this I was shocked to note that the +12V
output had altered its voltage significantly, rising to +18 Volts.

Inspection of the PSU showed that the main switch transformer looked very 'dirty' and my conclusion is that some of the insulation has melted off some of the windings. In short, this PSU is 'blown'...
(Even though still partly operational.)

I have therefore removed the PSU from the Falcon and made an adaptor that allows me to use an external PSU (from an old PC) to power the Falcon.

Having done that I entertained some hope of being able to use the Falcon with original keyboard again, since the heat producing PSU is now absent. This did not work at all however, as the ispLSI circuits of CT2 will still overheat all on their own, so I am still using a MegaST keyboard.

I have removed the fan from the CT2 CPU, and mounted it in the space where the PSU used to be, so that it blows air from that volume towards the CT2 CPU area. I have also replaced that huge (1dm diameter) fan I used for cooling the main CT2 board area (incl ispLSI chips) with a small fan that is intended for cooling Pentium CPUs, and have mounted this directly above the ispLSI chips.

Both of these fans now 'pick up' the +12V supply from the Falcon motherboard and not through the CT2 connector as before. The +12V on that connector is now only used for the Flash ROM.

Using this new setup I can now use TOS 7.x with decent stability, although none of this affects the other compatibility issues we have discussed, such as the PMMU usage etc.

372. STinG on a Mega2!

Newsgroup: comp.sys.atari.st
Date: 1999-06-08 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.990608222657.18175C-100000@halifax.chebucto.ns.ca>
Source record: 77473

Is it possible?

I managed to get STinG and CAB 1.5 on 2 - 720k disks and set up an auto folder so XBoot gets mostly everything working. However, it reports that STinG has not loaded its modules.

Having successfully run STinG on a Falcon, I believe I have the correct information in the STinG.INF file (using A:\ instead of C:\) and it points to the correct directory. The STX file are all there waiting but STinG can't see them for some reason.

Until I get them to load, the dialer reports 'Serial driver not found'. Also scc.prg bombs with 2 bombs on the Mega2 and CAB bombs with 3 bombs. I'm using a mono monitor.

This is the sequence:

I turn on the Mega2 (no HD) with the STinG 720k disk in the drive. The device driver shows, XBoot starts and loads the prg files from the Auto folder:

drvin.prg
mfp.prg
scc.prg (this reports 2 bombs)
sting.prg

the 4 cpx's load:

serial.cpx
sting.cpx
stngport.cpx
stngprot.cpx

STing starts up with the installation report line across but reports No Modules Loaded.

The STinG.INF file is in the AUTO folder along with STinG.prg. The INF file reads: A:\ (and nothing else) as I put all the STX files in the root directory. (Is this incorrect?)

Clicking dialer reports 'serial driver not found', the familiar warning I received while setting up the Falcon but that problem was solved once the STX files were loaded. Why don't the files load?

Inserting the CAB 720k disk for testing purposes, I click on CAB.app (1.5 version), the header pops up but the program bombs with 3 bombs prior to the completion of loading. The program is all there except for the readme files.

My ISP would like to offer Atari ST PPP support for the 1040, Mega2 & 4 as well as TT and Falcon etc. If I can get the Mega2 up and running, my next project is a 1040 STf with no HD.

Any ideas?

Thanks...

I use Calendar 6.3. When you enter an item you also key in the number of days warning etc. These are then displayed on the screen during boot-up either once a day or every time. Also includes times as well, a reminder to clear expired items, once only or repeat dates in date format or e.g. first Monday in specified months and so on.

It's not a null-cable (that would be a wireless connection I guess),
it's a null-modem cable. You can get them from just about any
electronics/PC shop.

subject of Null-modem questions....
>hi,
> golly gee, where do you buy these
>null-cables?? I need one for my ST and Amgia.
>james.

Hiya

Any computer store that's worth their salt will stock them. If you are
in the UK Tandy and Maplin also do them, I can't remember the prices
though.

If you know how to use a soldering iron, you can make your own!

Yep, but they're either commercial or pretty unstable. :) It would be
cool if the sources to AES4.1 were released (and why not, nobody is
making money with them anymore) so that they could be optimized and
bugfixed. It's pretty stable, just some bugs in the new AES extensions
and extremely slow, but well..:)

Maurits.

Correct, your setup loads a 16-point font by default. On ST-MID you'll
need an 8-point font.

> Do I need a mono monitor to run this version of MiNT?

Nope, nor for any other version. :) Just make sure an 8-point font is
loaded. Make sure that somewhere in your startup script, you give the
command

ttyvfont iso-atari-8.fnt (or iso-monaco-8.fnt if you like the Mac-look)
:)

389. DIY cables for the Atari Computers

Newsgroup: comp.sys.atari.st
Date: 1999-06-08 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7jilao$ssk4@news.ajou.ac.kr>
Source record: 77542

A while back a remember finding a Web Page that had lots of
diagrams and etc for making your own computer related cables.
I know that it did contain info on Atari Computer cables.

I lost the address for this site. Anyone know any web addresses
for DIY cables for the Atari range of Computers such as
RS232, LAN, Video, Audio and etc?

Also, I've been looking for any Web sites and or FTP sites with
anytype of hardware projects which involve or could be
adapted to the Atari 8-bits, ST/STE and Falcon.
Audio/Video projects and anything interesting.

I've done some searching for things like this and have found
a few sites. I think the good sites for stuff like this are
hidden or don't exist? ;)

Any address that you could pass along would be helpful.

Also, have been trying to track down some info on Video
Genlocks that were made for the ST/STE and especially the
Falcon without success.

I could use any info on Video Genlocks, I'd like to get
a good one for use on the Falcon.

Thanks,
phantomm@kih.net

390. HD Driver and FalconSpeed

Hi!

In article <7jgl69$l8f$3@news.campuscwix.net>,
darkchyld@pcc-uky.campuscwix.net (DarkChyld) writes:
> Where should the output go from this instruction? (it seemed to run,
> but I got nothing on stdout or /dev/console):

Of course not. cron is a daemon, it's not connected to any terminal. How
should it guess which terminal to write to? cron sends any output
(stdout and stderr) as a mail to the owner of the crontab-file (or the
user you supply in a MAILTO=-line in the crontab).

You've read the manpage, haven't you?

Ciao

Thomas

Technoid Mutant wrote:
>
> My machine is a Mega ST4 (4mb). Can I add ram so I can run X windows?

Hmm yes, with ExtraRam+8 you can add 8MB TT-ram to a (mega)ST(e), ending up with 12MB in total. I have no idea where to get that card these days though.

> Where is the startup script you referred to?

I'm not sure which distribution you use. Is it KGMD? In KGMD, the startup scripts are a bit of a mess to say the least (path being defined over and over again, very important settings only in .tcshrc, etc). If I remember correctly, the font is loaded in ~/.tcshrc, so only when you have tcsh as a shell. In that case, the font should be ok until you login, and then the font becomes unreadable. Is this what happens?

If so, the ttyvfont-command you want to change is in your homedir in .tcshrc (might also be in /etc/csh.cshrc though). And in case you use bash, also put a ttyvfont iso-atari-8 in /etc/profile. (This is a global startup script read by bash).

Of course, when someone telnets to your machine, the ttyvfont-command will produce an error ("Invalid function number") but it's not severe. In my own startup scripts I've included a check so that the font is only set on virtual consoles, but I don't remember how I did that, I'll check when I get back. :)

Enjoy :)

Maurits.

Well, Sting or MiNTnet actually. :) The nice thing about MiNTnet is that
it works just about the same as your linuxbox. Also, MiNTnet has a
growing support for network cards.

Maurits.

FalconSpeed has its own hard disk code which is independent from TOS
compatible hard disk drivers. This means that those limits can't be
removed.

Hmm...

I made a few calls yesterday, and was told of a rumor of a cartridge that
you can put a 3com isa card into, and it comes with linux source.

Now like I said, rumors abond, the last place I have to call is Best Elec,
and I have delt with them for years, and dont believe they will have the
product.

anyone in Germany know of a setup?

I really cant use the null modem method due to the megaSTE being a server
and the modem attached to it. I would have to have atleast 10megabit
transfer to feed 2 win98 boxes, and a falcon from the STE, and then the STE
should still have the power left in reserves to handle the mail and web
server services.

any further advice would be great!

I REALLY REALLY hate to see that box sitting there doing nothing, when it
could be the power house it is.

>can't see them for some reason.

That is very odd. But perhaps the explanation is your peculiar choice
of path (as mentioned below).

>Until I get them to load, the dialer reports 'Serial driver not found'.
>Also scc.prg bombs with 2 bombs on the Mega2 and CAB bombs with 3 bombs.
>I'm using a mono monitor.

SCC.PRG ?
I thought you were talking of a Mega2 ST. They have no SCC !
A Mega STe does have an SCC, however, so which is it really ?
ST or STe ? (Mega STe *should* have a harddisk.)

>This is the sequence:
>
>I turn on the Mega2 (no HD) with the STinG 720k disk in the drive.
>The device driver shows, XBoot starts and loads the prg files from the
>Auto folder:
>
>drvin.prg
>mfp.prg
>scc.prg (this reports 2 bombs)

At this point the Bconmap structures may have been damaged by bombing !

>sting.prg

If the Bconmap structures went 'bogus' above, then the SERIAL.STX has no
way of installing any legal STinG ports.

>the 4 cpx's load:
>
>serial.cpx

>sting.cpx

Remember that you can use the tools of STING.CPX to check for all modules.

>stngport.cpx
>stngprot.cpx
>
>STing starts up with the installation report line across but reports No
>Modules Loaded.
>
>The STinG.INF file is in the AUTO folder along with STinG.prg. The INF
>file reads: A:\ (and nothing else) as I put all the STX files in the
>root directory. (Is this incorrect?)

It is certainly inadvisable. Please try in a subdirectory instead.
The root directory is a special case, since the leading backslash is
identical to the final backslash. This may cause problems for some
string comparison routine in STinG, which expects to find the final
backslash somewhere *after* the first backslash...

>Clicking dialer reports 'serial driver not found', the familiar warning I
>received while setting up the Falcon but that problem was solved once the
>STX files were loaded. Why don't the files load?

I think they will if you use a subdirectory.

>Inserting the CAB 720k disk for testing purposes, I click on CAB.app
>(1.5 version), the header pops up but the program bombs with 3 bombs
>prior to the completion of loading. The program is all there except for
>the readme files.

This is probably because the CAB.OVL tries to talk TCP to STinG kernel
without any TCP module being loaded.

>My ISP would like to offer Atari ST PPP support for the 1040, Mega2 & 4 as
>well as TT and Falcon etc. If I can get the Mega2 up and running, my next
>project is a 1040 STf with no HD.

Others have done this too. STinG itself can run on a 520 machine, but few
of the clients can run on so small a system. (Certainly not CAB.)

>Any ideas?

Try again with the modules in a subdirectory.
The intention is that the path specified in STING.INF should be reserved
for STING-related files only, and that is never true of the root directory
anyway.

Hi;

Have you tried turning the drive on first, letting it run for 10 seconds or so, and then turning on the computer? I pulled my hair out for three days when I got my first HD and this was all that I was doing wrong. Apparently the drive takes a few secs to initialize.

Good luck.
Chris

Does anyone happen to know if HD Driver removes the limit on
the size of the Boot partition and
other partitions when using FalconSpeed?

I really need to know if it does or not.

phantomm@kih.net

Hi,

There is a version of Falcon Speed software greater than
what you or I have. It will remove the restrictions of the
version we are using. I have tried to get an update, but no
one seems to have it, or take the time to send it. I had the
version once, but didn't keep it when I sold my first card.
I got the upgrade from Robert, at COMPO in the U.S., at
that time.

Mike

406. Falcon Memory questions

Newsgroup: comp.sys.atari.st
Date: 1999-06-09 00:00:00 UTC
From: James Davies <jdavies@gromwin.demon.co.uk>
Message-ID: <7jm4o1$9l4$1@soap.pipex.net>
Source record: 77409

Hi Folks

I'm just about to acquire a 4Mb Falcon (I've got an STFM already), but I want it to have 14Mb.

1 - How much does the memory cost these days? For PC's/Mac's it equates to about ï¿½1 a Mb, is this the case with Falcon memory, or will it cost me more because it's scarcer?

2 - I live in the UK. Anybody know where I can get said memory?

Thanks for the help!

James Davies

Bof, risk is limited fan isn't an inductor, it's an AC brushless powered
in DC (electronic exists inside). -5V is protected by 1 ohm before U27.

>Now for some radical news !
>
>During my many experiments I have repeatedly measured the PSU voltages of

>output had altered its voltage significantly, rising to +18 Volts.

I know this PSU problem...
Last year I have resolved this problem (bad writes on my hard disk => bad
sectors), so I have replaced 2 bigs condensators side by side (5V was good
before). I think that this power supply checks only 5V.
```

>I have therefore removed the PSU from the Falcon and made an adaptor that

408. GFA source for plot program

Newsgroup: comp.sys.atari.st
Date: 1999-06-09 00:00:00 UTC
From: john@Cordes.Phys.Dal.Ca
Message-ID: <7jm7spceq1@News.Dal.Ca>
Source record: 77411

Sorry to repost this, but my machine just underwent a name change today.
For those who may want to retrieve the file by the WWW or by FTP, please
note that the machine name is now cordes.phys.dal.ca, rather than the old
jcordes.phys.dal.ca.

--
John

****
I have released the GFA (v3.5) source for my freeware plot program
(last version plot174a.prg). The archive is available for anonymous
ftp at cordes.phys.dal.ca, in the pub/atari directory. Or you can
use a browser pointed to the URL ftp://cordes.phys.dal.ca/pub/atari.

Here is an extract from the 00index file:

plot174a.zip: This archive contains the compiled binary plot174a.prg, the
GFA V3 source file plot174a.gfa and the ASCII version of the
source plot174a.lst. Also included is the most recent doc
file plot172L.txt, a sample .cfg file and finally a short
notice announcing the release of the source of my plot
program into the Public Domain. Freeware by John Cordes.

Be warned that the .GFA file contains over 9,000 lines
of source code; the complete zip archive is about 243K in size.

The program doesn't run on TOS versions 3.xx or higher, but it does
run well under PC emulators such as Gemulator and STonX. I still use
it occasionally for the built-in numerical utilities, such as numerical
integration, and root finding for both polynomials and transcendental
equations.

Enjoy!

John Cordes

409. SozobonX question

Newsgroup: comp.sys.atari.st
Date: 1999-06-09 00:00:00 UTC

Message-ID: <928949167.105.88@news.remarQ.com>
Source record: 77412

I have a question relating to SozobonX. Most of my experience on the ST is with Modula-2. I downloaded all the archives from the umich site, and I generate any TOS or TTP program, but no GEM apps. Where is appl_init located (or how do I access it?) I've looked in all of the header files and I see nothing.

I realise this is a pretty stupid question, since it has to be there somewhere, but I'm stumped.

Thanks,

Terry

OK OK OK.
Today someone came along with a so called 'Forget-me-clock'.
Into the ROM-port of a 520 or 1040 ST you have the system dat/time
always good (provided you use the special software in the auto-folder
to transport the data (date?) from the module to the system.

No Y2K problem.

But he complained beforehand already: the utility to set the
date/tame IN the clock only gives dates for the years 80 to 99.

After the year 2000 the clock and its time is OK but....

Just to clarify, I seem to be able to insert the bindings manually:

int appl_init();
int appl_exit();
int evnt_keybd(); for example, and then link with -lxaesfast.a

but there has to be a header file there somewhere :)

Core dDesigns (used to be Titasn Designs) in Birmingham do it IIRC it's about 70 UKP, basically it's an adapter that fits in your memory cards place and takes a 72-pin SIMM...

If you've ever used the ICD drivers for your HD, there may be a copy lurking on one of the software disks, masquerading as a MiNT CD-ROM setup. It's not the full MTOS, just MiNT and the AES IIRC.

Can't guarantee it's on all ICD versions, mine was the one that came with the Link1. Found it by accident, and was most surprised when I found it worked (after some fiddling). Not sure if it was supposed to be there, mind, but these were the ICD disks which came with the host adaptor (bought new).

I had the same problem with two different megafiles, both at about the
same time. In my case, it turned out that the power supply was
failing. That might not be your problem, it's something that you
could look into.

[random thought] - I don't even know why I'm responding to this, I've
tried to reply to five different posts, and none of them have gone
through, although the log file said they were accepted... (um,
basically, I'm trying to get a good new text to quoted text ratio
here, to see if maybe that works <grin>)

I have removed scc and it is a Mega2 (no HD).

> >STing starts up with the installation report line across but reports No
> >Modules Loaded. It says: Modules Loaded: None found.

I now have the modules in a subdirectory called 'sting' and the sting.inf
has this: a:\sting\

Still no luck.

> Try again with the modules in a subdirectory.
> The intention is that the path specified in STING.INF should be reserved
> for STING-related files only, and that is never true of the root directory
> anyway.

With the xboot, it now loads drvin and mfp fine (no bombs).
With sting files in the new sting subdirectory and the sting.inf with the
proper info, sting still doesn't load the modules. I even moved sting out
of auto and into a non-booting directory so I could manually start with
the same results.

I would say I'm STuK!

Some servers are not too keen on the PASV session connections, and you
should try using the PORT option and see if the results are better.

NEWSie originally had only the PASV option, but the 'Use PORT command
instead of PASV' might be just the thing for your particular server.

LHARC 3.** will handle any LZH file. It's available on FTP sites on the
internet as well as places like Delphi and Genie.

A shell program is also available that will convert LZH to ZIP, but you'll
need the LZH and ZIP unpackers to use the program. LHARC 3.** would be your
best bet; a gem shell program is also available.

: Hi, all.

: I have, as stated in previouse posts, got myself a CornerStone Dualpage
: 19" b/w monitor. I would like to be able to use this monitor on my TT, but
: I have no info on what the TT's ECL signals are like. The DualPage model
: is M/10720, and it is basically the same as model 120. This is the info I
: have about the DualPage.

Well, referring to my copy of a field service manual, what goes to the
mono monitor are MOUT and XMOUT, which come from DP8516 44-pin j-lead,
which is powered from +5 and -5 volt mains. I do not have a data sheet
for that IC, but it should answer most of your question. Those are pins 4
and 15 of the connector. My suspicion is that the differential voltage
goes from zero to ten volts.

HSYNC and VSYNC are pins 13 and 14 of the connector, and come from U204, the
TTVIDEO chip, which is powered between +5 and ground, so those are single-
ended TTL.

XMONO is on pin 9. It probably expects a ground from the monitor, if it
is like other Atari products.

There are two ways of getting power out of a transistor output stage.
One allows connecting a load beteen the positive supply and the collector
of of the transistor. The other allows connecting the load between ground
and the emitter of the transistor. That is what ECL means. It has speed
advantages, something about charge clearing time, I think, but is not
mysterious.

A TTM195 monitor, by its service manual, calls for Input Signal Video
of Balanced ECL, 120 ohms line to line. The horizontal frequency is
71 kHz, and the vertical freqency is 71 Hz, more or less.

Now: what precisely was the question?

I have an EZ-135 that just died on me. I first used it with my STf
and later as a utility HD on uther platforms as well. I would
format the Carts depending on the OS used. Alas now I have
about 6 driveless carts. I've had it about 3yrs and had expected
that I might lose an occasional cart but not the drive (nor the
Company). Any one heard of any repair FAQs for these, they
shouldn't require a "clean room"

If I cared about such things I'd never get anything done. ;-)
I have already removed the fan from the CPU heat sink, and moved it
into the space where the PSU used to be (I now use an external PSU),
from which position it now blows air in the direction of the CPU,
but not mounted on top of it.

>The Heat Sink is also large and is glued. I know better than to
>try and remove it.

Wise decision ! The heat sink is *definitely* needed regardless of fan.

>normally sit.

I use an extra fan mounted in this space, to blow cool air directly onto
the two ispLSI circuits (aka 'Lattice chips') on the CT2B board. Without
such extra cooling I have never been able to use the CT2B FastRAM.

Previously I used a large fan from a PSU for this, but now I use a small
1W fan from a Pentium cooler assembly. This fan is fastened to the 'bar'
of plastic that used to separate function keys from the main keyboard
area when I still had the original keyboard installed.

>Then, one might could put the keyboard on top of this
>plastic cover. If there would be no problems with making the keyboard
>connecting wires abit longer.

Centek warn against extending keyboard cables, but that mainly applies
to the reset signal. I myself use a MegaST keyboard for which I have

several extension cables, one of which is *very* long (6-7 metres).
This gave me no problems at all. For such long extensions only the
main four leads should be used (Vcc, TxD, RxD, Gnd).

----- snip ----- re: CT2B interconnection flat cable type

It might, but it may also hide any breaks if/when any do occur.

----- snip ----- re: Centek have tested some graphic cards with CT2B
>
>Hmmm...thats good to know, wish I knew which ones were tested.

As yet only Centek have this info.

>I have a good idea on how this was done, but there are a few ways
>of doing this.

Yes, many ways are possible, but which will work best is unknown.

>I hope that more than one card can be connected to the CT2B at the
>same time.

That will definitely require some 'tower' solution, rather than using
original Falcon case.

----- snip ----- re: placing cards 'on top' of each other

>the CT2B ribbon cable to end up short.

A 'little' longer should work, but there are no guarantees. Each extra
length added does increase the risk of 'pickup' and also increases the
parasitic capacitance and series inductance of the wires. At very high
frequencies such things do matter. After all, radio signals do not need
any conductors at all to bounce all around the earth, and the frequencies
ideal for such use are fairly low (around 4MHz).

>>As I'm not sure how it is done I can give no absolute answer, but my

>>as I don't work with D2D at all.
>
>ok, AFAIK with the CT2B one suppose to be able to return to
>a stock Falcon if needed. Does this mean that all standard
>clock speeds can still be used?

There is a compatibility boot mode available, where all clocks fall back
to the original speeds. This does not mean that all things go back to
normal however, as the DSP interrupts and some address decoding still
work in a slightly non-standard way. This has been discussed in other
threads here, mainly by me, Derryck Croker, and Didier Mequignon.
(I hope I spelled that right now..., french spelling is tricky ;-)

>I have a few more general questions about the CT2B.
>I do tend to ask alot of questions at times, just
>trying to get as much info as possible hope no one
>minds. ;)

Why should they ?
Sharing information is the main reason why newsgroups exist at all.

>The small resistor that is taped to the documentation,
>there is no way this can be installed wrong is there?
>Seems I read something about it could be incorrectly
>installed upside down or something like that?

Resistors are non-directional two-pole components.
As long as one end is connected to one of the points specified,
and the other to the other such point, with no breaks or short
circuits, it should work correctly.

>What is the best type of Memory to use on the CT2B?

Fast EDO type SIMMs.

>I have a 16meg 72pin Simm that I use in my Falcon
>with a Ram Karte memory board. Will this Simm work
>correctly as Fast Ram in the CT2B?

Probably not. The CT2B SIMM *must* be an EDO type.
EDO means that data outputs are enabled in an 'enhanced'
manner, leading to more efficient access cycles. The CT2B
design relies on this ability for its high FastRAM speed.

>Also, any known problems with after market memory
>upgrade boards with the CT2B such as the Ram Karte
>or the Ram Gizzmo?

I have no idea. Centek claim that some boards give
'glitches' on the video signal outputs, but I have
not had any problem with my homebrew 14 MB board.
(Just holds a 72 pin SIMM with no extra electronics.)

>Must one install a FPU in order to use the CT2B?

I don't think so, but I never tried it without one,
so I don't really know.

>I notice in the documentation that a modification
>to the Falcons VGA adapter may be needed for
>extended resolutions with non multi-sync monitors.

Yes, because they hardwire a signal that needs to
be cut free for the new video clocks to work right.
(Else one clock is disabled by a short circuit!)

>I have a 17inch SVGA that I am using with the
>ScreenBlaster II external hardware and software.
>Can I still use the ScreenBlaster II hardware/software?

I doubt that the hardware is appropriate to use with
CT2, as I am fairly sure it involves the clocking of
VIDEL and COMBEL. CT2 needs to have control of them.
(Running them at 50 MHz for both turbo modes.)
But I have no direct experience of ScreenBlaster.

>If so, does the ScreenBlaster II hardware fix the bug
>with the VGA adapter that the documentation mentions?

I have no idea about any ScreenBlaster stuff. I use
VI myself, and I never heard of useful ScreenBlaster
resolutions that VI can't give me without hardware
patches, so I never saw much point in them.

>Any additional info about the VGA modification and
>what kind of extened video modes will not be
>obtainable if this modification isn't done would
>be helpful.

If you don't do the mod, then one of the clock signals
generated by CT2B will be shortcircuited, which is not
a good idea. The signal can be turned off in the CT2
configuration, but that will limit your choice of
available pixel clocks in turbo modes to 25 or 50 MHz.
You will no longer have access to the 32 MHz clock,
as it is this that uses the extra input/output pin.

>Someone told me awhile back that there was problems
>with doing MIDI stuff with the CT2B.
>This may only be a rumor.
>Are there any know problems with MIDI?

I have no MIDI equipment so I can't say for sure, but
I doubt it, though there may be some timing dependent
programs around that expect a slower CPU (bad methods).

I can say that there is no problem at all in using Midi
for STinG networking though, which is how I use those
ports.

>When doing the CT2 wire soldering there is
>a part where you have to remove the chip at
>U44. Is it really necessary to break pin 15
>of that chip and use it in the socket?
>Or can one use a pin from a different chip
>or maybe a componet leg like from a resistor?

If you can find a suitable connection place to
get the same signal, then it will suffice to
bend the pin of the U44 chip so that it does
not enter its socket, nor must it come into
contact with anything else that conducts.

>I don't want to destroy this chip unless I have to.

I understand, but as I myself chose to do so, I have
no idea where best to connect the wire if not using
the socket for it.

>And, I'd like to get a few extra Inductors that
>are exactly like the one at L102 on the Falcon
>Mother Board. Anyone know the technical info
>on that inductor at L102?

Sorry, my service manual only states:
"IND FERRITE BEAD AX", which is the same as is
specified for others that even look different.
Ferrite material comes in many different 'classes'
for various uses, and this is not mentioned at all.

The only way to get an exact replica would be to
order it (or the info) from a supplier of spare
parts for Falcon, such as 'Best Electronics'.

I agree, as it is specific to all 'modern' TOS (>= 1.04) as compared to
'old' TOS (< 1.04), but as TOS 1.04 was the first TOS to allow the new
partition sizes many naturally associate the change with this TOS version.
In some disk partitioning software this even affects the dialog buttons.

>> beyond the third will also be AHDI compatible...? I don't think so.
>
>This is my understanding -- it would be the first time that I hear that
>this actually is NOT compatible...

Like I said, I no longer use ICD software, but I do remember some problems
I had that seemed to be due to this incompatibility. Still, if those who
do use ICD drivers do not have those problems, so much the better.

>so how do I set up STinG to work with MultiTOS?

Sorry, but MultiTOS is a piece of software still under development, that now will never be completed as Atari dropped their support for it long before they ceased to exist. (Bought up by company that fired all staff).

One of the bugs in MultiTOS apparently causes a bus error to occur when any exchange of STinG packets is made. It even happens for local traffic without any ISP connection at all. I strongly suspect that it is an incorrectly used interrupt masking of a task switching routine that has this effect, but it has not been proven. It is very hard to prove, as no debuggers work reliably under MultiTOS either.

I am afraid this does mean that STinG can not be used with Atari MultiTOS.

This is really not much to grieve over though, as attempting to use that system even without STinG on any regular basis is a proper nightmare. It has the worst 'compatibility rating' of any multitasker, and is extremely unstable even if only Atari software is used throughout.
(Which in itself would be too limiting.)

All other multitaskers will work fine however, including those that are considered as the functional 'heirs' of the MultiTOS project, which is primarily NAES, which is used with MiNT in the same way as MultiTOS was. Geneva and all versions of MagiC also work fine with STinG.

Are you really saying that STinG works under MTOS then...?

This I've got to try, as I never could get MTOS to run reliably
with or without STinG, but it does 'reliably' bomb whenever I
use any STinG traffic.

I'll try again with the MiNT version you mention here though.

That only applies to some very old MiNT versions that were unable to
boot \AUTO\ programs after itself properly. Modern MiNT versions do
not have that problem AFAIK.

>MiNTNet is supposed to be the best TCP/IP stack for use with MiNT
>though.

MintNet was written specifically for MiNT, and works with nothing else.
STinG was not written for MiNT at all but for all TOS compatible systems,
and does work fine under MiNT as well. Which of these approaches is 'best'
is up to the taste of each user.

What does not work fine, however, is MultiTOS (with or without STinG),
and one of the MultiTOS bugs is 'allergic' to STinG traffic.

EZ-IP is a special service that allows all users of dynamic IP's to have a
static name of their own, that other Internet users can use to access that
user's machine. It is thus a way of making your local servers accessible
to your friends over Internet when you are logged on.

With the new clients STinG users can easily make use of this service.
All info is available in an ST-Guide hypertext on my STinG pages, so
browse there and check it out if you are interested.

Quite correct. You need a multitasking AES.

>STinG!

Aha, so this is the reason I can't repeat some experiments that did work
'once upon a time'. I have lost my copies of AES 4.0, so I can only test
with AES 4.1 now, and that definitely does not work with STinG.

>I downloaded FreeMiNT 1.15.1 and it does look good, and preliminary

Good for you !
I'd like to have that AES version again for testing purposes.
Do you know where I can get it ?

>Only problem is that CAB causes a bus error immediately when trying to

Sorry, I wish I could help, but with the MTOS AES version I have I
can't even get as far as you do.

>Any ideas? It could be something in the MINT.CNF as this new FreeMiNt
>one has a lot more stuff in it I don't understand than my old one ;-)

Well, it *could* be a MiNT problem of course, but I suspect an MTOS
problem anyway (that's always my first suspicion when MTOS is used).

Hi

Your description of the problems a very vague and so is very hard to
help you.

What is the problem! You say you have an ICD link & link 2, which one
are you using? Have you a hard disk driver installed and is the hard
drive self-booting?

Cheers! for now;)

This is in the Quick FAQ.

The only way to do this at he moment, because of the lack of networking
hardware, is with STinG and a null-modem connection, which is slow.
There are some people working on drivers for network cards, but they
seem to be far from then end of the tunnel yet.

First you need a driver. Normally, if you follow the instructions that
came with your ICD stuff, it should be installed by now. Otherwise you
can get AHDI from the Quick FAQ, or you can buy HD Driver which is
faster and more reliable.

For the desktop, all you need to do is to add the new icon (Capital "C",
not "c"), and save the desktop. If you don't save it, then the icon will
be gone next time you boot.

You don't need scc.prg on a Mega2. MFP.PRG should be enough.

> sting.prg
>

Are you sure this is the order in which the programs are loading ? If
so, it looks correct (except for the scc.prg).

What message does sting.prg display ?

It should be ok. The resolve.stx should be the last to load too.

>
> Clicking dialer reports 'serial driver not found', the familiar warning I
> received while setting up the Falcon but that problem was solved once the
> STX files were loaded. Why don't the files load?

It looks like STING hasn't loaded, or it couldn't find the .stx files.

> Inserting the CAB 720k disk for testing purposes, I click on CAB.app
> (1.5 version), the header pops up but the program bombs with 3 bombs

Did you change the start page ? The start page should be a local HTML
file, not an online one.

> Any ideas?

Remove the scc.prg, and check what message STING.PRG returns

AHDI is free. You can get my own personal distribution at:
http://www.multimania.com/bales/ahdidisk.zip

CBHD can be found here but it's in german. There are english docs
floating around somewhere.
http://www.geocities.com/SiliconValley/3366/atari.html

HD Driver is commercial, and can be bought from you nearest dealer. I
would suggest Systems Solutions if you're in the UK. The author can be
found here:
http://acp5.chemie.uni-kl.de/seimet/index.html

It could be. It could also be that you are using the wrong type of disk.

> How many sectors and how many tracks are used by real Atari ST ????
> Is it (?) Sector 10 and Track 80 (for DD 720kb???)

Yes, for normal disks. However, if you are trying to make pirate copies
or demos, they often use an extended format, like 11 Sectors and 82
Tracks, that a PC sometimes can't even write, to get 800K or 810K onto
the disk.

> Why any of *.st images have 81 tracks or 9 sectors ??????

huh?

454. MSA format? (Sources, specs.)?

Newsgroup: comp.sys.atari.st
Date: 1999-06-10 00:00:00 UTC
From: Joachim Nilsson <dat95jnn@mds.mdh.se>
Message-ID: <Pine.GSO.3.95.990610190929.29837A-100000@legolas.mdh.se>
Source record: 77349

Didn't want to loose the uptime on my machine and boot DOS so
I started looking around for a MSA->ST converter for Linux.

Since I didn't find any I switched over to finding the specs.
or sources for MSA (Magic Shadow Archive) but I couldn't find
them either ... anyone with ideas, links?

/Jocke

455. Re: Help wanted

Newsgroup: comp.sys.atari.st
Date: 1999-06-10 00:00:00 UTC
From: Steve Stupple <Steve@atari.org>
Message-ID: <om+M2BAag$X3Ewqw@steverosie.demon.co.uk>
Source record: 77350

On Thu, 10 Jun 1999 at 14:08:50 a message from was created on the
subject of Help wanted.
>I had use "Makedisk" program to write *.st program to bootable disk for
>real ST with parametres "/write" on my PC.
>
>Disk was formated and overwritten in ST format. But if I insert this
>disk into real ST, it not getting boot. I can read disk directory but
>nothing more. Is possible that's in case of wrong quantity of sectors
>and tracks ?????

If the disk doesn't have an Auto folder with programs in, and then they
have to be with the .prg extension, then YOU have to run the software
from the Desktop.

I have come across a couple of commercial games that fool the system in
looking in the root directory to run a specific program, Hi-Tech used it
on one of their cartoon games!

>
>How many sectors and how many tracks are used by real Atari ST ????
>Is it (?) Sector 10 and Track 80 (for DD 720kb???)

Sector and track is a big subject in itself, I'll do what I can though;)

The bog standard ST using the Desktop's format function will either
format double or single sided, take your pick, at 9 spt (sectors per
track) and 80 tracks (0-79).

>
>Why any of *.st images have 81 tracks or 9 sectors ??????

It is possible to increase the sector and tracks and therefore increase
the space on the disk. To do this you will have to use a third party
formatter to write the extended format.

Although it is possible to format 11 spt, this I don't recommend unless
(1) you have a good quality disk, (2) your desperate!

I have come across commercial software written using the 11 spt and they
have all had problems. I would say 50% of problems concerning erratic
data reads and writes that I've come across in the past have been with
using 11 spt!

Most people use a 10 spt and 81 (0-80) or 82 (0-81) tracks. I always
suggest 81 tracks but 82 tracks if you intend to use the disk yourself.

The reason is that I've come across a few drives that won't go above
track 80, I know I had one! and there are a few more drives that won't

read above track 81. On the other hand there are drives that can read
above track 82

I hope this has helped a little.

You can't use it _in_ Cubase, but you can export standard Midi files which
you can then import into Cubase.

Hi All,

One of the NGs I subscribe to (binaries.mods) regularly has items posted
in a number of parts. No problem; I simply drag each file onto MUNPACK.TTP
and it re-assembles the complete file.
How can I split my posts in a similar fashion so my PC friends can put them
back together automatically (I cannot see anything in the Newsie docs that
covers this) ?

TIA

Jim.

Hmm, yes, I'm afraid it is ;-(

>There are some people working on drivers for network cards, but they
>seem to be far from then end of the tunnel yet.
>
Well, seems that finally my pocket ethernet adapter works OK with STinG.
I can 'ping' a PC with a PCI ethernet card running win95 and M$ network,
and STinG's Dialer statistics report correct values of packets going
in and out of my TT. I can also correctly read UDP packets coming from
the PC network, asking for my reply ;-)

The adapter I have uses a Realtek 8012 ethernet chip and I've build a
cartridge to parallel port adapter with 2x74LS374 and 1x74LS244 chips
(both very cheap and widely available).
Zero One Technologies (ZOT) was selling adapters based on this chip for
some time, I have no idea if they still do so or which other companies
produce pocket adapters based on Realtek's chips.

Diagrams and software will be available very soon, I need to make some
'cleanup' on the sources since I have also an older RTL8002 adapter and
I think no one needs all those 'IF OLD_ZOT=1' etc in the sources ;-)

Sources will be available too, so that others can adapt the driver for
other pocket ethernet adapters. The problem is that programing these
little beasts is a bit on the hard side, so anyone that wishes to try
it, should have enough info from the card manufacturer. Realtek's docs
are 30 pages, and one needs a lot of guessing (or PC disassebly ;-) to
make this thing to work. Users of D-Link DE600 should find it easier to
port the driver for their adapters since there are info for them from

the TUW project and from MintNet's xif drivers.

My driver was based on Peter Rottengatter's project for the Rielb cards and that means that there is already a driver for them in STinG's 1.20 archive ;-)

For STinG to communicate with PCs we still need NFS or something similar, but for the moment I think that using my FTP Server and a PC FTP client will do the job just fine.

> (the odd- and even story!)

The software for Junior Prommer fixes this, and also Pinatubo. I wrote a PRG
for this a long time ago, but can't seem to find it. Pinatubo is freeware I
believe.

The EPROMs should probably be the 27C010 if your sockets are 32 pin. You can
use almost any kind if you care to make extra circuitry. A 74LS139 can split
the CE (Chip Enable) signals to drive four, eight or sixteen EPROMs.

> the ispLSI chips.

Why not using small metal heat sinks? The same type as on Intel CPU:s, but smaller. A drop of silicon paste and then the metal "hat" on top of the hot chip, and off you go.

You can even make your own. I did that for a GE-Soft SCSI adaptor which was so hot it would burn your fingers. After a hefty cooling "hat" the SCSI adaptor worked like a dream.

In fact, I heard of crazy experiments with PC motherboards in freezers. The CPU clock was reportedly overclocked 300%! I'd be wary of the ice in the freezer though. Moist is usually no friend of electronics... However, I never saw this myself. Could be a modern myth?

Another fun way to cool your system would be to dip the whole motherboard into an aquarium filled with distilled water (saltfree). All chips would then get considerably more cooling than in air. That 50MHz quartz crystal could be swapped for a 60MHz? A 70MHz... get my drift?

Only problem would be corrosion...

:^)

In article <375db3fa1aff162@oden.se>, Ronald Andersson <dlanor@oden.se> wrote:
...
>I had believed that fVDI was intended to fulfill exactly the same purposes
>as NVDI does, thus fully replacing that system enhancement. Evidently that

That is indeed the _intention_, but if it ever happens (NVDI supports
lots of printers and similar things) it's a long way off. I certainly
have no intention of spending time writing printer drivers myself
(I've not even had my printer connected the last three or four years).
However, a lot of the existing code (such as the monochrome driver)
should be very useful to build on when writing a driver for a printer
that expects bitmaps of some kind.

For the time being, cooperation with another VDI/GDOS will be
necessary for people who want to be able to print things.

>more compatible with those of NVDI, it might be more appropriate instead to
>try to use methods that let both fVDI and NVDI work together.

There's nothing wrong with being compatible with NVDI, if it can be done
legally and without too much trouble.

>But then that must mean that it also needs to be compatible with some
>GDOS loaded 'on top' of it (by later \AUTO\ program I mean). And so,
>fVDI must not report any GDOS at all as being present (XGEM -2), as
>doing so would lead to other GDOS versions refusing to load.

I've only tried it with NVDI so far and that works fine. If there is
a problem with other GDOSes, it's simple enough to add an option to
the fVDI configuration file to turn off the 'report GDOS' function.

>>So far there are no printer drivers etc for fVDI so I'm not sure
...
>If fVDI is to implement them ast all, then they must of course be
>implemented fully compatibly with existing implementations. What

I actually don't agree. If they were to be fully compatible with
existing implementations, there would be no need to involve fVDI in
it at all. You should just use another VDI together with fVDI.

If you have a printer driver you want to use, surely you must also
have the GDOS it was supposed to work with?

>we need least of all right now is further divergence in standards.

Has anyone except the NVDI developers written any printer drivers the
last few years? _Is_ there a 'standard' for this available anywhere?

>>- Use fVDI as a background VDI.
...
>I see. That should then allow NVDI to work as 'front VDI' for fVDI as
>'background VDI'. Correct ?

Yes. And that works very well.

>>- Use fVDI as a front VDI.
>> fVDI will now deal directly will all devices it has drivers for
>> (currently only the screen). You can, however, set it up to pass
>> all operations on specific other handles (including the workstation
>> open/close calls, of course) through to the next VDI, and thus
>> still 'support' all hardware that VDI knows about.
>
>Here I do not understand you completely. There are of course different
>types of handles involved, for physical and for virtual workstations.
>The latter can not possibly be known at configuration time, so you must
>be referring to the physical workstation handles. Correct ?

I'm referring to both actually. For a workstation open call, the handle
(if that's what those are called) would indeed be the one from
ASSIGN.SYS, and that's what you'd tell fVDI to look out for initially.
Both for the v_opnwk and subsequent v_opnvwk fVDI will intercept the
calls and allocate handles for its own use. These are the handles that
will be returned to the application, but whenever they are used fVDI
will replace them with the 'real' ones before calling the background VDI.

>Here you seem to imply that we can also use NVDI as 'background VDI' with
>fVDI as 'front VDI'. Correct ?

Yes, but things wouldn't work in quite the same way.

>One problem with this could be the special way in which NVDI manipulates
>XBRA chains so as to keep itself 'on top'. I have had to 'work around'

There are, unfortunately, various problems with ending up 'on top' in
a Trap chain. Currently fVDI won't even do that when booted alone since
GEM modifies the vectors itself after fVDI has loaded.
I'll look into this further later on.

>In both cases above, the slowdown effect can be kept to a minimum by
>using table driven function access internally.

The dispatchers in fVDI are rather efficient (but I currently leave
quite a few debug things in there), but there is unfortunately still
a fair bit of work to do before the correct routine is called.
With two VDIs on top of each other much the same work will be done
twice, but there's no way around that.

>>>I hope you implemented XBRA for this vector too, for it is a system
...
>Use of XBRA is thus not optional, but absolutely mandatory.

OK, OK. I'll do it. ;-)

[Regarding reuse of mouse/keyboard I/O]
>>Eventually I'll have to replace them, though, since not every system
>>that could potentially run fVDI will _have_ an old VDI to rely on.
...
>That may be so, but I wonder if it will really be practical to use one
>and the same binary for so wildly different systems.

It may not be, but with the current driver concept in fVDI there is
a default routine that will be used if the driver doesn't override it.
The easiest default behaviour to implement is of course a fall-back to
another VDI.

>>>scant info already available, I believe it should be possible to achieve
>>>sufficient compatibility to make drivers mutually exchangeable.
>>
>>I actually don't think there's much chance of that, but as described

>You a probably right. My comment was based on the assumption that fVDI
>itself would be both a screen driver and a full GDOS replacement. If it

It is (or rather will be) a full GDOS replacement (not necessarily
driver level compatible), but that's of little use without drivers.
Those drivers will not appear until/unless someone actually writes them...

>is even a contrary need, to not use the same methods, as only one GDOS at
>a time can be permitted to interpret ASSIGN.SYS etc.

fVDI reads FVDI.SYS instead, which is very similar but not compatible.

>>The fVDI drivers are in essence similar to the LineA functions. That is,
>>a selection of primitive operations that can be used to implement more

>>function (only for operations on that device of course) as well, though,
>>if necessary.
>
>I think that this will indeed be necessary for lots of functions, to gain
>acceptable efficiency.

Apart from functions that may not ever be implemented in the fVDI engine
itself (there are various strange things to do with printers and such),
I really doubt there will be a need to replace things very often.
A PostScript driver would obviously need to do so, though.

You should try the current fVDI (where none of the drivers override any
VDI function at all) and compare it to NVDI for screen output.
If there was any significant efficiency problem GEMBench etc should
show it rather clearly.
On my machine fVDI (which is admittedly currently optimized mainly for
the '040) is slightly slower than NVDI on a few things, about the same
on some and significantly faster on other. It's been a while since I
tested it on any other machine, but the results were similar.

>>A basic fVDI driver would only contain pixel set/get routines and some
...
>Slow indeed ! That would incur a horrible overhead for breaking down more
>complex operations into single-pixel operations. I'd estimate that over
>90% of the work done would consist of such conversions alone... Surely

Much of the slowdown is actually in the pixel set/get routines
themselves. Instead of an inner loop containing a couple of instructions
to read/update the right pixels (which can often be done several at a
time), with 'built in' screen address update, a subroutine call (or two
if the old pixel value is needed) has to be done per pixel. Apart from
saving/restoring a bunch of registers, the subroutine has to calculate
the screen address each time (this could be optimized somewhat, but it
would still be very slow).

As an example, a single pixel set in monochrome mode requires more
40 instructions, including a complete register file store/restore, while
the inner loop of the monochrome replace mode fill contains a single
instruction that fills 16 pixels at a time...

>any serious driver would have to implement much more than this.

Yes, of course. It's very helpful while working on drivers, though.
You can have something running in just a few hours and then add
accelerated routines one at a time.
To get a feel of how much the different acceleration possibilities
help, try turning them off one at a time (information on how to do
that can be found in the example FVDI.SYS file itself).

Looking for help. I can control the cursor with the keyboard when booted but no mouse control. Looking for an alternative, maybe hooking up an PC keyboard to the Mega.

Thank you for any suggestions.

No, there really are some very disturbed people out there. Just have a
look at this: http://www.accsdata.com/drffreeze/Dr%20Ffreeze.htm

MiNTnet would be much better suited for this, as it will basically
provide the same functionality as Linux. MiNTnet also has drivers for
the various VME ethernet-cards if he can find one.

> There are some people working on drivers for network cards, but they
> seem to be far from then end of the tunnel yet.

There are quite a few drivers available, mostly for MiNTnet. If you
have a computer with a Hades/Milan-compatible PCI-BIOS (only the Hades
and Milan ATM, but that will change) you can use the PCI-drivers in
MiNT'98. There are also NE2000-drivers for the Panther ISA-adapter, but
AFAIK this will only work on STs, not STE.

First of all, you can not install Linux on your MSTE (unless it has a PAK3) since Linux needs atleast a 68030. Some people will tell you that Linux now works on STs as well, but don't listen to them, UcLinux is not the same as Linux...

Go for a MiNT/MiNTnet setup instead, it has much of the same functionality as Linux but is much smaller.

Of you could install Linux on your Falcon, that should work although it won't be very fast.

> about some people networking thier falcons and ste's to a
> tcpip network, but I have no idea how to get the hardware

It's not easy, as there is no ethernet-hardware available for these computers. If you're very lucky you might find a VME ethernet-card for your MSTE, but that's all. Unless you go for the D-Link DE600 (very, very hard to find) and build yourself a ROM-port adapter for it. This will work on both the MSTE and Falcon, but it's not very fast (100Kb/s perhaps).

478. NEW/IMPROVED ATARI BBS LIST June 9,1999

Newsgroup: comp.sys.atari.st
Date: 1999-06-10 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <375F6CA5.7210@geocities.com>
Source record: 77442
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I am pleased to announce this is the most up to date list that I have
put together. All the numbers that could be found on www.holyoak.com
were recompiled into the following. This is sent to you to update your
records so that innocent people aren't called in the middle of the night
due to wrong numbers. (Like I've been doing all day. ;))

Take care fellow Atarians,

Doctor Clu / Greg Goodwin

PS: For updated information on this list, since I publish it every so
often, please write to:

clu-da-bard@geocities.com

Atari BBS List 6/09/99

Maintained by Trevor Holyoak <trevor@holyoak.com>

Please keep me informed with updates to the list and I'll post revisions
as necessary. In particular, if one of the BBS's is within your local
calling area, please give them a call and let me know whether they're
currently operational.

All boards are assumed to be operational 24 hours a day, 7 days
a week unless otherwise noted.

The format of the individual entries is below.
Note that each entry uses at least five lines (all of which are
less than 40-columns in order to make this easily 8bit readable):
"Type" indicates the type of hardware used to run the board.
"Status" is whether the board was up or not the last time it was
checked.
"Status Date" tells you when the entry was last updated.
--
There can be one or more lines of "Notes".

An asterisk (*) next to the board's phone number indicates that entry
has been updated since the last version of this list.

Try re-installing the driver. This will re-write the boot-block on the HD
and refresh the driver file.

480. Help wanted

I had use "Makedisk" program to write *.st program to bootable disk for real ST with parametres "/write" on my PC.

Disk was formated and overwritten in ST format. But if I insert this disk into real ST, it not getting boot. I can read disk directory but nothing more. Is possible that's in case of wrong quantity of sectors and tracks ?????

How many sectors and how many tracks are used by real Atari ST ????
Is it (?) Sector 10 and Track 80 (for DD 720kb???)

Why any of *.st images have 81 tracks or 9 sectors ??????

Please, let me know.

Dali

I don't have those disks any more, only cleaned up disks with the utilities
I find useful. 'Found' useful I should say, as I no longer use ICD drivers.
In any case, I don't have that MTOS AES on those disks.

Thanks for the suggestion anyway.

That is also a perfectly valid method, but it would not be sufficient in this case. The area where the CT2B ispLSI chips are located is enclosed by a sort of triangular tube, formed by the CT2 board itself, the FastRAM SIMM, and the Falcon keyboard. The only efficient way of cooling anything inside such a 'tube' is by mounting a special fan to blow air 'sideways' through the tube, in the manner described by Didier Mequignon for his system in other posts. Unfortunately I have not found any fan with a suitable shape/size for this.

I tried mounting a small fan on top of the ispLSI chips inside the 'tube', but enclosed this way it could not cool the chips sufficiently. The same would of course also be true of any simple heatsinks. The heated air would still stay in the same volume, thus making the heatsinks ineffective.

>You can even make your own. I did that for a GE-Soft SCSI adaptor which was
>so hot it would burn your fingers. After a hefty cooling "hat" the SCSI
>adaptor worked like a dream.

Yes, I can see how it would, but heatsink cooling requires some freedom of movement for the heated air, which is not sufficient under a Falcon keyboard.

>CPU clock was reportedly overclocked 300%! I'd be wary of the ice in the
>freezer though. Moist is usually no friend of electronics... However, I
>never saw this myself. Could be a modern myth?

No, variants of that story are true, though I doubt any of them that pretend a normal freezer would be suitable. There are companies in the US that have specialized in cryotechnics for PC computer acceleration. Their solutions include cooling methods similar to those of a normal freezer, as well as some more 'exotic' ones.

>Another fun way to cool your system would be to dip the whole motherboard
>into an aquarium filled with distilled water (saltfree). All chips would

>then get considerably more cooling than in air. That 50MHz quartz crystal
>could be swapped for a 60MHz? A 70MHz... get my drift?

I know that distilled water does not conduct current well, but I doubt that it is a perfect isolator either. In any case, even perfectly pure H2O will not remain pure for long, and any impurity and/or ionization will make it conduct *very* well, so that would hardly be safe.

A much safer, and *far* cooler method would be to use a fluid inert gas rather than water. That method has actually been in use for quite a while. It is a standard method for cooling so-called 'supercomputers'.
(Crays etc.)

The nice part about it is that once a conductor has reached those superlow temperatures it will no longer generate any dissipation heat when a current is passed through it, as supraconduction will reduce voltage drop to almost nothing. It is also possible to do some very 'funny' things with magnetic fields at these temperatures.

Your post did come through ok here anyway. In fact, your problem may
simply be a misunderstanding. Possibly your news handler (whatever it is)
considers it unnecessary to present your own posts for your reading, as
you have already seen these when sending them. It could just be a matter
of configuring the program to show them to you.

Yes, of course, but it is no reason why you should not have loadable drivers
based on your own methods, especially if NVDI authors will not document their
methods.

>>But then that must mean that it also needs to be compatible with some
>>GDOS loaded 'on top' of it (by later \AUTO\ program I mean). And so,

>the fVDI configuration file to turn off the 'report GDOS' function.

I think that will indeed be necessary for several GDOS versions.
It is definitely needed with AMC-GDOS, both in its original forms, and
in the patched form I made to add XBRA handling to all bent vectors.

>>>So far there are no printer drivers etc for fVDI so I'm not sure
>...
>>If fVDI is to implement them ast all, then they must of course be

>
>I actually don't agree. If they were to be fully compatible with
>existing implementations, there would be no need to involve fVDI in
>it at all. You should just use another VDI together with fVDI.

Precisely. That is what I meant by the phrase:
"If fVDI is to implement them at all"

because if fVDI does implement all driver types, like a real GDOS
implementation, then it must also support those driver types that
a normal GDOS implementation supports.

Otherwise you would have to 'reinvent wheels' over and over again,
just to replace a lot of drivers that already exist.

>If you have a printer driver you want to use, surely you must also
>have the GDOS it was supposed to work with?

No. It has worked fine using old drivers with NVDI.
I haven't tried with all drivers of course, nor with a large number
of printers (as I only have had a few printers). In fact I don't
even think I have tried it at all in the latest NVDI.

Still, what is the point of having a so-called standard if it gets
redefined for each new release of GDOS/NVDI. That would be silly.

Extending compatibility upwards is one thing, but invalidating
all old drivers on a regular basis is another. That is simply
not acceptable.

>>we need least of all right now is further divergence in standards.
>
>Has anyone except the NVDI developers written any printer drivers the
>last few years? _Is_ there a 'standard' for this available anywhere?

I am not well informed on that, but if there is not a standard, then
I don't see how anyone ever could produce any drivers, and some do
exist, and they have worked interchangeably for several GDOS vesions
as well as NVDI.

As for the interface used, I think that your earlier comments on the
simple dispatcher approach are relevant here.

>>>- Use fVDI as a background VDI.
>...
>>I see. That should then allow NVDI to work as 'front VDI' for fVDI as
>>'background VDI'. Correct ?
>
>Yes. And that works very well.

Good. As NVDI has gone quite a bit beyond the normal VDI and GDOS versions
for many things, I think that many will want precisely this combination,
using fVDI only as a screen driver, and NVDI for all the rest.

It really would be unnecessary duplication to invest a lot of work to make
fVDI into a replacement for all the things handled by NVDI.

>>Here I do not understand you completely. There are of course different
>>types of handles involved, for physical and for virtual workstations.
>>The latter can not possibly be known at configuration time, so you must
>>be referring to the physical workstation handles. Correct ?
>
>I'm referring to both actually. For a workstation open call, the handle

>(if that's what those are called) would indeed be the one from
>ASSIGN.SYS, and that's what you'd tell fVDI to look out for initially.

Ok, then I do understand you.

>Both for the v_opnwk and subsequent v_opnvwk fVDI will intercept the
>calls and allocate handles for its own use. These are the handles that
>will be returned to the application, but whenever they are used fVDI
>will replace them with the 'real' ones before calling the background VDI.

That is sort of like an extra abstraction level for handles then, much as
local file handles are translated to global handles in multitasking kernels.
The important thing is that nothing ever must 'bypass' such translation
when several VDI layers are installed, as that would lead to confusion.

>>Here you seem to imply that we can also use NVDI as 'background VDI' with
>>fVDI as 'front VDI'. Correct ?
>
>Yes, but things wouldn't work in quite the same way.

No, I realize that, and I suspect that it might be better to make a definite
choice of how fVDI can and must cooperate with NVDI and/or other GDOS. That
might help in making some implementation details simpler and more consistent.

>>One problem with this could be the special way in which NVDI manipulates
>>XBRA chains so as to keep itself 'on top'. I have had to 'work around'
>
>There are, unfortunately, various problems with ending up 'on top' in
>a Trap chain. Currently fVDI won't even do that when booted alone since

Good. Such methods should only be used when/if needed.

>I'll look into this further later on.

Yes, for good NVDI cooperation I think you will have to study it in detail,
even if you then decide to avoid using such methods yourself.

>>In both cases above, the slowdown effect can be kept to a minimum by
>>using table driven function access internally.
>
>The dispatchers in fVDI are rather efficient (but I currently leave

Some of that is inevitable of course.

>With two VDIs on top of each other much the same work will be done
>twice, but there's no way around that.

True, but all the more reason to optimize each interface as far as possible.

>>>>I hope you implemented XBRA for this vector too, for it is a system

Yes, that should be so. Provided that they really are compatible...

>>You a probably right. My comment was based on the assumption that fVDI
>>itself would be both a screen driver and a full GDOS replacement. If it
>
>It is (or rather will be) a full GDOS replacement (not necessarily

>Those drivers will not appear until/unless someone actually writes them...

But that is precisely where 'fallback' compatibility with old drivers can
help some. Then only drivers for new stuff need to be developed.

>>is even a contrary need, to not use the same methods, as only one GDOS at
>>a time can be permitted to interpret ASSIGN.SYS etc.
>
>fVDI reads FVDI.SYS instead, which is very similar but not compatible.

Ok. At least that should not introduce any conflicts.

>A PostScript driver would obviously need to do so, though.

Possibly I misunderstood you earlier. I suppose I shall have to experiment
a bit with the current fVDI to fully understand some of your points.

>You should try the current fVDI (where none of the drivers override any
>VDI function at all) and compare it to NVDI for screen output.
>If there was any significant efficiency problem GEMBench etc should
>show it rather clearly.

Ok, I'll try it when I have time. (Always a problem...)

>On my machine fVDI (which is admittedly currently optimized mainly for
>the '040) is slightly slower than NVDI on a few things, about the same

>on some and significantly faster on other. It's been a while since I
>tested it on any other machine, but the results were similar.

Well, as you probably know from other posts my own main system is a Falcon
with CT2B, so that is significantly different from your test environment,
which should make test results all the more interesting.

>>>A basic fVDI driver would only contain pixel set/get routines and some

>time), with 'built in' screen address update, a subroutine call (or two
>if the old pixel value is needed) has to be done per pixel. Apart from
>saving/restoring a bunch of registers, the subroutine has to calculate
>the screen address each time (this could be optimized somewhat, but it
>would still be very slow).

I see. Actually you might want to consider other call methods than the
normal subroutine linking and register stacking. They are good for the
purpose of making generic consistent interfaces, by standards implemented
for most C compilers etc, but they are not very efficient.

>As an example, a single pixel set in monochrome mode requires more
>40 instructions, including a complete register file store/restore, while
>the inner loop of the monochrome replace mode fill contains a single
>instruction that fills 16 pixels at a time...

And even that single instruction will execute much faster than even one
of the 'movem' instruction at entry/exit of the subroutine would...
Yes, the problem is obvious.

>>any serious driver would have to implement much more than this.
>
>Yes, of course. It's very helpful while working on drivers, though.
>You can have something running in just a few hours and then add
>accelerated routines one at a time.

That is true. This 'single-pixel' ability should only be regarded as
a development tool then, never to be used for multi-pixel work in a
finished driver.

>To get a feel of how much the different acceleration possibilities
>help, try turning them off one at a time (information on how to do
>that can be found in the example FVDI.SYS file itself).

Ok, I'll check that out later then.

That is your problem then. If you inspect the original STING.INF file of
the release package you will note that the path is written in upper case.
That is a required usage for this file.

Btw:
I have tried booting STinG from floppy on several systems here, so I know
that it does work properly with a correct set of files on the diskette.

>Mike
>

I really need this updated version. Currently the version I
have is 6.2 to the best of my knowledge.
Months ago, I was trying to read some of the German Atari
News Groups and remember seeing a posting about a version
higher than the one you and I have, but didn't know what
updates it contained. I probably still have that posting
archived here on the hard drive.

If anyone out there has this updated version of the
FalconSpeed software, I'd be willing to pay or trade
Atari Software and maybe even Atari hardware for it.

To the best of my knowledge FalconSpeed is no longer
supported. I did contact COMPO in the US about any
upgraded versions and was told that I had the current
version. Apparently there has been a update since then.

If anyone has this updated version, contact me by
e-mail and we'll try to work something out.
Or you can send me the updated version with the
updated text file by E-Mail if you don't require
any thing in return for it.

Thanks,
phantomm@kih.net

Thanks for this address, most useful. ;)
>
>
>Any special cable in mind?
>
Yes, My LAN, MIDI, and DSP ports on my Falcon need something on them.
:)

If possible, I'd like to use the LAN port with a Modem to connect to
the Net with.

Also, I would like to use the LAN port as a Null Modem connection to
connect to a STE and a ICD Multi I/O RS232 port.

I'd like to use the MIDI ports for networking with STing.
Will standard MIDI cables be enough or is there sometype of
modification that needs to be made?

Also, I'd like to find sometype of DSP cables/connectors to
do some experimenting with.
I just got DoItF030 haven't read thru in all. Might be sometype
of projects for the DSP in there.
A DSP to modem would be cool, if possible.

>
>A couple of cables have been impossible to find, although it doesn't mean
>they don't exist:
>
>IDE 44p hi density (for 2.5" drives, as in the Falcon) to standard 40p IDE.
>I've made a couple of these.

I'm not sure if this is the same thing or not, but when I bought a 2.5
Western Digital 540meg IDE hard drive I got a small adapter board that has
a Female 44pin connection on one side and a 40 pin male connection on

the other. Also the board has what seems to be a standard SCSI type
hard drive power supply connector that has 2 wires connected to the
board where normally you would find 4 wires. There are 4 pins in
the connector but only 2 pins have actual wires connected.
I didn't think that IDE drives required this type of power connection.

I did not try to use this adapter board as the WD 2.5 IDE worked fine
in the Falcon with the standard Falcon IDE cable.
Would you know what this adapter is for and can in be used in the
Falcon?

>
>SCSI 50p (internal flat ribbon) to ??p SCSI for 2.5" drives.

Not sure what you mean here. Are there 2.5 SCSI drives?

>
>There are also very special cables, like the Blitz copier which uses both
>the printer port and the external floppy port at the same time. This one you
>have to make yourself.

I have one of those, Works real well.

Would you happen to know if there is anyway to connect a second
3 1/2 disk drive to the Falcon. I'd like to add a standard ST/STe
type floppy port to the Falcon.

Do you know if the Falcons monitor port can be used with a monitor
by its self without any of the Falcon monitor adapters connected?

Also, One thing I would very much like to see come about is Driver
Software for some of these Video Capturing Devices.
Recently, I saw advertised a video capturing device called QuickClip.
This device plugs into the parallel port and only costs $39.00 USD.

With Expose no longer being produced to the best of my knowledge.
These PC types video capturing devices would be the answer for
anyone wanting to capture color video.
Drivers have been created for things like Scanners, Why not
Color Video and Sound capturing devices?

I'm sure the Falcon can handle this, especially if you have
a CT2, AfterBurner or Nemesis installed. But a stock Falcon
should also be able to do this as well. I know I get great
color video with Expose on my stock (at the moment) Falcon.
It would be great if some drivers where created for these devices.
Apex Media for the Falcon could quite possibly be updated to use
some of these. There are alot of these devices on the market
and I bet most of them are about the same hardware wise.
Doug has always been very helpful in answer my questions and etc.
I'll try to e-mail him and ask how hard it would be to do such a
project.

Thanks,
phantomm@kih.net

488. Atari Software/Hardware for Trade

Newsgroup: comp.sys.atari.st
Date: 1999-06-11 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7js7ot$5ke3@news.ajou.ac.kr>
Source record: 77302

I am looking for folks who would be willing to trade
Atari hardware and software.

Currently I have alot of ST/STe original games most
are in boxes.

Also have Atari ST/STe hardware that I would be willing to
trade.

And some Falcon software/hardware that I may consider
trading.

Mostly what I am looking for is Atari Falcon hardware/software.
Commercial and shareware. Graphics and Audio related but anything
that I don't have will be considered.

However there are some Atari ST/STE software and hardware that
I am looking for.

As an example I'm looking for the following,
*Falcon Software
Rainbow 2 graphics software
Neon 3D graphics software
Xenomorf 2 graphics software
ChromaStudio 24 graphics software
PrismPaint 2 graphics software
AudioTracker Audio software
TrackCom Audio software
Latest version of the Falcon Speed Software

*Falcon Hardware
Just about anytype of Falcon Hardware.
Video Genlock
Expose, working or not working.
ScreenEye
Upgrade boards working or not.

*ST/STe
Hardware
Replay 16 cartridge
Any type of PC emulator hardware boards.
Video Genlock

*Software
Latest version of Diamond Edge
Latest version of Speedo GDos

Also interested in collections of registered
Shareware software for the Falcon/STE.

If you are interesting in trading or selling software/hardware
then e-mail me with a list of anything you are willing to part with.
I'm located in the US, but overseas folks are welcome. ;)

Thanks,
phantomm@kih.net
.

Most Newsgroups no longer limit the sizes of individual posts as they
used to do, so you do not need to post multiple parts. NEWSie does
not provide the ability to split a post into multiple parts, because
this feature would become useless as newsgroups allowed larger posts.

493. Stoop v1.05 key?

Newsgroup: comp.sys.atari.st
Date: 1999-06-11 00:00:00 UTC
From: J WILKINSON <jwandjw@ihug.co.nz>
Message-ID: <37607C23.1B615D24@ihug.co.nz>
Source record: 77367

Hi there,

I have recently had a 2.5" IDE disk in my Falcon
die a death. I'm running with an old SCSI disk but
didn't have a backup of Stoop v1.05 boot manager.
I had emailed the author previously (years ago)
to obtain a key which he gave me happily, but I
cannot get him at the same email address anymore.

Is anyone aware if the author has a new email? Or can
anyone attach the key to a reply email to me?!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

I'm afraid that "music program" is a bit vague. What do you want to do,
MIDI sequencing, MODs, Audio recording ?

495. Newsie news timeout

Newsgroup: comp.sys.atari.st
Date: 1999-06-11 00:00:00 UTC
From: mgrove@iwvisp.com
Message-ID: <929086226.432.57@news.remarQ.com>
Source record: 77369

I'm subscribed to a provider that utilizes supernews as a news provider instead of running their own server. After making a connection to the news server, if I have no activity after only a minute or two, I loose the connection to the news provider and have to reconnect. The provider cannot change this because it is not part of his system. Is there a way to automatically signal (ping?) supernews while I am busy to keep the connection going?

Thanks,

Mike

That last suggestion is actually the one you want to go for..:) The author of Stoop has stopped developing it when his Falcon died, and turned Stoop in to Freeware. Since he wasn't able to create a final version without shareware limitations, he made the key (for use with his own name) publically available. I don't know where it is but it should be on the usual Atari ftp sites.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

Hey! Dr Ffreeze is fun! Talk about dedication to cooling!
There is an interesting mentioning of peltier elements and dielectric oil
for better cooling.

My own idea of putting the motherboard into distilled water was just a joke,
but I once also joked about altitude meters in cars, until i met a guy that
had one...

MG

---From the discussions:---
Hi, I'd like to tell you that my company, DSI, has special dielectric oils
that cool much better than conventional transformer oils, and work much
better at low temps. It's called OptiCool Fluid, and you can check it out at
our website, www.dsifluids.com. E-mail me with any questions. We sell five
gallon quantities for $190 and 55 gallon quantities for $450.

Well, since he doesn't have a keyboard, MIDI sequencing is out of the window for a start.

The only option if you want to compose music, is to use a program known as a Sound Tracker. You can get hold of a copy from http://wombat.ludvika.se/dhs/ and goto the DHS files section.

You will find a program called Protracker. If you have an STE or STFM, make sure you get the ST version, else if you have a Falcon, get the falcon version.

In the program, there is a very long and helpful file which will help guide you through the program. I found it a very easy way to make music on the Atari.

I couls explain what a SOund Tracker is, but it would take too long, but anyway the document in the program I told you to get WILL help answer any questions you have, but if you get very stuck then just post a message onto the newsgroup.

I hope you have fun, Baronvr

It surely is not in a way.
You can really overclock chips when you cool them down from say a
modern normal 65 C to -30 C.

When cooling to say 7 C (coolbox) you do not get much profit for your
trouble.
DEEP-freeze is needed.
They do that with so called Peltier elements. heat transporting
diodes.They are not efficient. To take away say 80 W of heat the
element ends up with heating the environment with 400 W.

And indeed the big problem is: condensation of water vapour. That
means: no airflow. That means: cooling with heat-pipes.

Nice if your profession is a plumber.

507. [ANN] CoMa 5.0.0 supports MicroLink Office

Newsgroup: comp.sys.atari.st
Date: 1999-06-11 00:00:00 UTC
From: Hartmann@ThePentagon.com
Message-ID: <1dt8xuu.9gkgbfzd6j7kN@stardust.isdn.cs.tu-berlin.de>
Source record: 77381

Programme-Name: CoMa for Atari Voice/Pro 5.0.0 (COmmunication-MAnager)

Purpose: Fax & voice-mail-system, to send & receive fax,
answering machine, mailbox & terminal with internal z-modem

Requirement: Computer with MagiC[Mac|PC] or TOS

Download: from Softbaer-Mailbox: +4930/62709-572 (ISDN X.75 & V.34)
or homepage: <http://i.am/Softbaer>

CoMa_Atari_5.0.0.zip (550 KBytes

****

CoMa has the following common functions and attributes in all levels

- English documentation
- Support for the Elsa MicroLink Office & USR 56k (Pro)Message(Plus) modem
self-mode(read fax and voice & configuration)
- Fax-class 2 & 2.0
- Polling (send poll-request-tone only with class 2.0 and some class 2-modems)
- Network-capable fax-job-management (3 jobs in 24 hours)
- Serial fax
- Display of the calling-number with ISDN-modems
- Display of call units with ISDN-Modems
- Internal editor
- Incoming pages are displayed during fax-reception !!
- Text can be mixed with graphic-logos and signatures
- Fax-voice-data-number management, including groups
- Management for incoming fax/messages/mails
- Administration of 8 telephone companys
- Zone- & and time-dependent selection of telephone-company
- Mailbox with internal send & receive-z-modem
- Terminal mit internal z-modem

* * * * * * * * * * CoMa Voice (additional) * * * * * * * * * *

- Answering machine for ZyXEL, Elsa/TKR, USR, Dr. Neuhaus, Lasat
and much modems with Rockwell-Chipset
- Day & time programmable answering messages
- Multiple outgoing messages for several ISDN-MSN
- Time dependent redicrection of incoming calls
- Remote control / recall of new received faxes
- Recall of 7 special messages by DTMF-code
- Real time decoding of sound for Mac/Atari-Soundsystem of ZxXEL
ADPCM3/ADPCM4, Smarty/Cybermod u-Law- & Rockwell ADPCM4-Sounds
- Wave-Sound conversion in ZyXEL- & Cybermod- & Rockwell-format

* * * * * * CoMa Professional Version (additional) * * * * * *

- Fax- and voice-on-demand-system
- Any amount of messages via DTMF tone recall is possible
- Each category can contain up to 100 messages and/or 100 fax-pages.
- Statistic of category recalls
- Voice-messages can be put together from multiple voice-files.
- For the mailbox you can assign personal passwords and
download-folders to as many users as you want
- Personal message for each caller, who has an entry in the numbers-list
(with ZyXEL Elite & MicroLink ISDN, if caller MSN is displayed)
- Unlimited fax-jobs
- Faxtransmission via polling request (DTMF-PIN not needed -
only for Class 2.0 modems)
- Permanent poll-sender possible (caller gets fax pages even without
sending a poll-request)
- Time-dependent messages for 10 MSNs for ISDN
- Connect-kind can differ for each MSN

* * * * * * * * * * * New in CoMa 5.0.0 * * * * * * * * * * * * *

- Support for Elsa MicroLink Office Self-Mode
- Readout faxes and messages
- Configuration

- Self-Mode works with USR Message Plus Modem
- Self-Mode-box opens with Shift-F3
- USR Self-Mode: if no receive-time has been stored, the time when this file was transfered
to CoMa calls-list is shown
- USR Self-Mode: Function for record and play of outgoing- and full memory-messages via
CoMa

- Voice-On-Demand and Fax-On-Demand window is opend with Shift-F2
- If line is busy on "Dial Voice", redialing is active now
- To choose a folder with several voice-files the button "folder" has to be active in
Preferences/MSNs & Messages.
- Pause with space-bar if a message is played back via computer-loudspeaker

- The 8 kinds of entrys in the calls-list can be marked with a colour
- Used telephone company for fax transmission is written into the logbook

- Edit field for exchange line (needed if you use a private branch) is now in
preferences/general
- Shift-functions-key works also with right shift-key

- Various bugfixes

****
<mailto:S.Hartmann@berlin.de> or <mailto:SiggiH@gmx.de>
<http://i.am/Softbaer> or <http://ww.ThePentagon.com/Softbaer>

I too have a registered version 2.1 which I use now and again when I want to quickly produce a list of directions for members of my diving club.

It is also useful when I travel somewhere that I haven't been to before. It helps to verify my chosen route against Routefinder.

I have only made a few mods to my route file, mainly on the English south coast. I did try replacing the coastal outline map with a more detailed one but I ran into problems. IIRC Routefinder seems to not like too many 'points' in the map file.

It would be nice to see some updates to this application to make it more Falcon/TT friendly and more multi-tasking friendly.

I wonder if any non-British versions exist as it is fairly easy, if slow, process to create map files.

Peter.

I've got HD-Driver on both my ST with its Syquest 230Mb SCSI and on
my Milan with its 2Gb hard disk and CD drive both IDE. I even had
HD-Driver working with a redundant Iomega 150Mb exchangeable before I
fried it by connecting the 5V and 12V the wrong way around (*&^%$**!)
(If anyone knows how to fix this drop me a mail)

My question was...
Exactly what formats are supported on the ST platform at the moment?

Also I don't understand why I need a separate driver (Spin) for my CD
when I have HD-Driver. Is there a technical reason for this or was it
just a decision not to support CD drives. DVD drives are supported so
I assume that they have more in common with MO drives than with
CD drives.

Any chance of adding Firewire support??

511. Re: STinG on a Mega2!

Newsgroup: comp.sys.atari.st
Date: 1999-06-11 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.990611175346.4290I-100000@halifax.chebucto.ns.ca>
Source record: 77385

I've checked and rechecked.

The odd thing is when I insert the floppy disk into my Falcon and click
through the various programs, Sting can find the modules and load
them with no problem. The Mega2 doesn't seem to see them.

On Thu, 10 Jun 1999, John Kolak wrote:

Sorry. Actually, my short term goal is to capture the music output as
.YM files. After that I'm going to use a new program to convert them
into Vectrex game console images and create a Vectrex music library.

Even so, such a motor does have inductance, and there can be spikes when
it is switched on or off, but those risks can be minimized by parallel
capacitance and a parallel zener diode + low resistor. That should limit
any spikes and prevent harmful currents from reaching the supply.
(Some motors even have such protection built-in.)

From the PSU point of view the whole package will then seem mostly like
a simple resistive-capacitive load which is normally harmless.
(Unlike inductive loads.)

>sectors), so I have replaced 2 bigs condensators side by side (5V was good
>before). I think that this power supply checks only 5V.

I think the feedback can only deal properly with a single voltage, as there
is only one switch transformer. They simply rely on the other voltage to
be proportional to the one being regulated. Normally that will work, and
this method is in fact used on all Atari PSUs that I know of.

Somehow that 'proportionality' had been shifted in my PSU, such that the
+12V outputs delivered +18V even though the +5V outputs remained at their
normal +5V voltage. I had assumed this was due to damage to transformer
windings (their isolation rather), but I may actually have seen an effect
of undampened switching spikes. As I did not view this on my oscilloscope
but only checked it with a multimeter, the difference would not be obvious.

I intend to keep using the PC PSU now, but I would still like to know exactly
which capacitors you replaced. By this I mean the 'condensators' that you
referred to above. (Btw: they are called "kondensator" in swedish too :-)
My PSU is one made by 'Skynet Electronics' in Taiwan. Was yours the same ?

>>I have removed the fan from the CT2 CPU, and mounted it in the space where

>>the ispLSI chips.
>
>Big modifications !

Yes, they were, and the fact that such changes were needed make me very
doubtful about any claims by Centek that 'many users' (as they say) can
simply install CT2B per instructions and use it fully in a normal closed
case Falcon. I simply do not believe those claims at all any more.

>>Using this new setup I can now use TOS 7.x with decent stability, although
>>none of this affects the other compatibility issues we have discussed, such
>>as the PMMU usage etc.
>
>I'am happy for you. What is your average temperature in your room ?

Ambient temperature when all equipment has been off (rarely happens) is about
20-22 degrees Celsius. With all equipment on I think it is around 5 degrees
higher. But the ventilation here can't do much about direct solar heat that
comes through the windows, so I expect to see temperatures of around 35
degrees in parts of July and August.

If you have a Falcon030, also take a look at FlexTrax. It's a new
soundtracker
for the Falcon030 that makes full use of it's DSP processor. It features
effects like reverb and delay, not available in any other soundtracker for
the
Atari series of computers. Have in mind that the software is still under
development, and the version out now is a beta version.

FlexTrax can be downloaded from our homepage:
http://home.swipnet.se/newbeat/

All the best,

524. Stacy and Mega STE for sale - any offers?

Newsgroup: comp.sys.atari.st
Date: 1999-06-12 00:00:00 UTC
From: Electronic Cow <electronic_cow@dial.pipex.com>
Message-ID: <7jstqp$t8r$1@lure.pipex.net>
Source record: 77307

Hi there!

I need some more space to make room for the TT I've just got, so if anyone's interested in the following, let me know:

1 x Mega STE (4Mb RAM, TOS 2.06, 365Mb SCSI hard drive internal) with mono monitor, mouse, and cables. Good, clean condition, and works perfectly.

1 x Stacy (4Mb RAM - upgraded from 2Mb, TOS 1.04, 80Mb internal SCSI drive). Excellent condition, works perfectly (even the screen's great for a Stacy). This Stacy is the revision with the attachments for a battery pack, so you can build one if you want! :)

1 x copy of Avalon version 2.0. Practically brand new condition. Professional sample editor for the Atari with sample transfer, FFT editing. Much better than Replay 16, or Zero-X. It doesn't run on the Falcon or TT because of the copy protection, hence the sale.

Usual rules apply :)
Sensible offer secures. Buyer pays postage or collects. Can both be seen working. E-mail me!

525. 1st Word + to PC files? Help!

Newsgroup: comp.sys.atari.st
Date: 1999-06-12 00:00:00 UTC
From: Chris Owen <krisdebt@globalnet.co.uk>
Message-ID: <7jtb2mhfp1@gxsn.com>
Source record: 77308

Hi,
Can you help?

I still use my old 1040st for sequencing but have gone over to the PC for everything else.

I have a number of old text files in 1st Word+ format that I would like to transfer onto my PC. How can I do this?

I only have internet access on my PC. Is there a program that can read ST format discs on a PC and then translate 1st Word files into a suitable format for use on a PC word processor?

Some of these old files are seriously large and valuable. Any assistance you can give would be really appreciated!

Cheers

Chris Owen

Sorry :-) in french it's condensateur... I can't verify all words.

>referred to above. (Btw: they are called "kondensator" in swedish too :-)
>My PSU is one made by 'Skynet Electronics' in Taiwan. Was yours the same ?

I don't know, I can verify if you want (my falcon is closed ;-)).
On my PSU I can found 3 x 1000 uF at right of transformer, and specially
2 x 1000 uF side by side (and in //) near outputs. One of them was bad
(traces visibles to the naked eye on this condenser and PSU card). I have
replaced 2 x 1000 uF by a big 2200 uF because I havn't found the same voltage
(and size !).

>>>I have removed the fan from the CT2 CPU, and mounted it in the space where

>case Falcon. I simply do not believe those claims at all any more.

At temperature's problems Centek propose an update of my ispLSI chips (new
timmings for DSP !), I don't understand. There are 3 months, just after my
CT2B installation, I have talked to Centek that my DSP clock not works
(I use 50 MHz of oscillator), this new timmigs resolves this problem.
You know my DSP works fine with clock always at 50 MHz, so I want not
update my card for this problem only.
I have also talked to Centek this MMU patch (bus error for acces to
adress < $800 in user state), I hope an update of setup for remove
my patch in auto-folder...

Hi Martin!

In this month's issue of PC Answers (yes I know, but I was after the cover CD with a library of web graphics on it!!) there's an article about a guy in Singapore, who's got his processor watercooled!

He's made a waterjacket out of sheets of copper to go over the chip with two pipes running to the cold water tap and sink, which replaces the heatsink on the chip.

I'll repeat the warning though: don't try it at home, one leak would fry your machine!!!!

Cheers!

James

a friend of mine is going to trade his atari for an iMac. He has his record collection stored in an Atari database program, which has the *.dmf extension. We tried to save the database file in ASCII-format, but it didn't work out. Since I'm not familiar with atari computers, I'm asking you for help.
How can I rescue the file by saving it in text-format or Comma Seperated Value-format?
Any help would be appreciated, you can also mail answers to my e-mail adress: vroegime@iquip.nl

Thanks!

Meindert

534. Falcon with CD/Syquest unit problem

Newsgroup: comp.sys.atari.st
Date: 1999-06-12 00:00:00 UTC
From: Jeff Jewell <jjewell@ix.netcom.com>
Message-ID: <3762A588.96DF198A@ix.netcom.com>
Source record: 77317

I recently got a Falcon system with external hardrive and an external unit containing a CD-ROM drive and a Syquest 44meg unit. I hook everything up and get this message:

ExtneDOS Pro version 1.1
CD ACSI/SCSI BOS Driver v2.4A
Error Device not responding

ISO9000/HS Driver v2.4A
Error Unknown device

The CD and Syquest units do not respond but the hard drive does.

The Syquest drive powers up and the lights seem to indicate it's ready. The CD gives no indication as to its status. I've tried the cables the only two ways they might logically go (SCSI in or out on the CD/Syquest unit) with the same results. I've got manuals I'm about to start digging through, but does anyone have any ideas that might save me some time/headaches?

Thanks,

Jeff

Peter (and all),

I have wondered how easy it is to create map files as I'd love to play with one of (portions) of the United States.

Is this option available to those with registered copies? Or did it require a special arrangement with the author?

Doug Kendall

Hi

What database program is it for? I can't remember if it's the Timeworks
database program or not.

If so what happens when you try and save it in ASCII format?

I know you can't save, as you would normally do, but you have to print
it to a file; you have make the normal adjustments, like columns etc.,
you would when if you were printing a hard copy.

>
>Some of these old files are seriously large and valuable. Any assistance you
>can give would be really appreciated!

I've not come across a PC program that can import or use First Word+
files!

The best way around this would be to save the files as text, by removing
the tick against word pro mode in one of the drop downs, and then doing
a save as. Try and use the txt extension as they have different meanings
on the PC, doc with get it in the Word Pad while txt with use the
Notepad if double clicking on them;)

Format a double density disk to 720K on the PC and then just copy the
files onto the disk with your Atari and they can then be read by the pc.

I hope that helps!

We're getting many of the same requests for help just lately, or is it
me!

You should check that the SCSI chain is properly terminated.
I don't know about Extendos 1.1 but normally with the Gold version
INSTALL.APP must be run if the configuration files are non functional.
This allows you to either install a CDROM from new or update an
existing system. When you run it you may should see the CD unit
identify and you can then set its drive assignment.
With the Syquest unit run the Atari hard drive utilitues, or if you have
it HDDriver HDDRUTIL.APP & see if the system is detecting the drive.

Of course, Modem 2 and Serial 2 do allow access to more than 19200 (up
to 230K)! The bug I refered to is *not* the serial bug which can be
corrected by Hsmodem, it is a *hardware* bug. The modication I mentionned
has nothing to do with serial ports themselves, but with a programmable
chip.

>The logging onto the internet/BBS should not affect unzipping of files.
>Usually software provides checksums to check the integrity of files,
>using comms packages, using FTP parts of the downloaded file are added
>in order to complete the file (if I've read correctly)!
The Mega STE hardware bug leads to CRC errors *after* the file has been
received (and checked) by the software (otherwise, it could never occur
with Internet protocol). It almost never occurs on text and/or short
files, but is more likely to occur on huge compressed files. I know what
I'm talking about, I struggled with it for 3 months, it almost drived me
mad :)

For those of you who used the free service from ez-ip...

Effective immediately, the EZ-IP project is closed to the general public. Preferred members will continue to have access to all EZ-IP services. This change in policy is the result of continued abuses on the part of "Free" account holders. We have enjoyed serving the community with this project over the past 8 months and are truly sorry that it has become necessary to close membership. Over the next few weeks, we will be revamping the EZ-IP site and application process to allow users to "upgrade" to Preferred Member status.

That's right off the web page... All that work you did Ronald Andersson .. I guess we'll have to see if it works with the paid service.

Awesome! I missed some BBS's... that's the best news I've heard all
day! So what other BBS's are on the Forem Net, and are they set up with
networked message bases much like the fido net message bases are?

Thanks,

Doctor Clu

I don't have an ST Format with that in it, and the Stoop 1.05 I grabbed from ftp://ftp.lip6.fr/pub/atari/ doesn't have a key file within it or listed in the docs...

It would be much appreciated if you could email me the key.

Kind regards,

553. Pacifist - I Need More Memory

Newsgroup: comp.sys.atari.st
Date: 1999-06-13 00:00:00 UTC
From: <cool@borg1101.freeserve.co.uk>
Message-ID: <7k06pt$38s$1@news7.svr.pol.co.uk>
Source record: 77330

I am using Pacifist V049b and I can't get it to give me more than 14Mb Ram I have 64Mb so it should allow me
32Mb I would of thought.

In the Pacifist Ini file where you can change what it does it says

Ram=32

But still only gives me 14Mb does any one know how to get around this.

Since you have a Mega STE (as indicated at the end of your message),
your problem is typical of the Mega STE hardware bug, which prevents using
anything faster than 19200 BPS. The problem comes from a programmable
chip, which can be replaced with a debuged one. Instruction on how to do
this can be found on ftp servers, in the file FSER096B.LZH.
Otherwise, you can contact me by email.

Hope this helps,

>

According to the info I have, serial 2 allows access above the 19200
without modification! You still need a patch like HSmodem to correct the
serial bug.

The logging onto the internet/BBS should not affect unzipping of files.
Usually software provides checksums to check the integrity of files,
using comms packages, using FTP parts of the downloaded file are added
in order to complete the file (if I've read correctly)!

The file could be faulty! you can also get this error code when trying
to run and AUTO folder only program from the desktop!

<snip>

>I've not come across a PC program that can import or use First Word+
>files!

There is a program that converts First Word+ files to RTF format. It's
called wpls2rtf and is available as DOS and TOS executables. Since I
can't remember where I found it, I've uploaded it to Demons FTP site.
It should be in the Atari file list in a few days.

In the mean time, if anyone wants a copy, its about 130kb, mail me and
I'll pass on a copy.

Source record: 77334

Hi!

I've got a Falcon for Sale. Here is a quick description
of it:

- 14MB Ram/Nemesis
- 540MB Internal IDE HD
- Added a fan on top of CPU
- Refitted original fan on top of PSU
- Original Case, box, manual, looks new, works great!
- Reason for selling: Moved to linux on a cheap PC...

The only problem it has is that one of the audio Input
doesn't give the proper input level when recording (you have to
adjust them at different levels). I don't know what causes this, but
nevertheless they still works!! (The outputs are fine.)

if you're interested, Give me a shout!

Gilles

Read the Pacifist readme file it says you cannot have more than 14 megs and in my expireience many programs don't like that setting! 4MB is the highset amount of memory an ST ever had or needs - only Falcons have 14MB. Stick to 2MB or 4MB I say there both colossal amounts in Atari terms!

Check that the drives have different assigned ID's as well....Also, try
using Metados, sometimes it picks up things that Extendos doesn't (and vice
versa admittedly), try tio get as many different .Bos and .DOS drivers for
Metados as you can though...Which HD driver are you using?

The STe only supports up to 1Mb per SIMM....that said it's possible your SIMM's will work OK, but only give 1Mb each. It is almost impossible (given how the various things work) that you could do any damage to either by pluigging them in and finding out....

> 'tube' is by mounting a special fan to blow air 'sideways' through the
tube,
> in the manner described by Didier Mequignon for his system in other posts.
> Unfortunately I have not found any fan with a suitable shape/size for
this.

Funny, this weekend I saw an old tapestreamer with such a fan. It sucked the
air out of the streamer horizontally and disposed of it upwards.

> I tried mounting a small fan on top of the ispLSI chips inside the 'tube',
> but enclosed this way it could not cool the chips sufficiently. The same
> would of course also be true of any simple heatsinks. The heated air
would
> still stay in the same volume, thus making the heatsinks ineffective.

The important thing is to lead the heat away from the chips. If the heatsink
or air around the daughterboard gets hotter is of secondary importance. Of
course, the cooler the surrounding is, the sooner is the heat transported
away from the chip...

> Yes, I can see how it would, but heatsink cooling requires some freedom of
> movement for the heated air, which is not sufficient under a Falcon
keyboard.

Seems you'll have to find some kind of tube, like in aquariums, and pump the
air around with that?

> A much safer, and *far* cooler method would be to use a fluid inert gas
> rather than water. That method has actually been in use for quite a while.
> It is a standard method for cooling so-called 'supercomputers'.
> (Crays etc.)

Another way is finding a deep cave with constantly low temperature and an
ethernet connection...

:^)

No seriously, this cooling technique your're mentioning sounds promising,
how available is it for hobby purposes?

> The nice part about it is that once a conductor has reached those superlow
> temperatures it will no longer generate any dissipation heat when a
current
> is passed through it, as supraconduction will reduce voltage drop to

almost
> nothing. It is also possible to do some very 'funny' things with magnetic
> fields at these temperatures.

I wonder what the cost would be (in watts) for such a system to work with
one enclosed motherboard?

The diskdrives and harddisks should be left aside for such an experiment,
since the mechanical parts would shrink enough to cause great problems.

Best would be to split the computer into two parts, a "not-so-hot" part and
a "needs-much-cooling" part.

But that would in fact mean a new development of a motherboard,
daughterboards, etc.

Buy an ordinary Mac-to-modem cable.

> Also, I would like to use the LAN port as a Null Modem connection to
> connect to a STE and a ICD Multi I/O RS232 port.

The previously mentioned Mac-to-modem cable can be complemented with a small
null-modem box or factory made cable.

> I'd like to use the MIDI ports for networking with STing.
> Will standard MIDI cables be enough or is there sometype of
> modification that needs to be made?

Standard cables will do.

> A DSP to modem would be cool, if possible.

Believe there are such cables for the Mac.

> Would you know what this adapter is for and can in be used in the
> Falcon?

It appears to be a 2.5" to 3.5" adaptor for IDE drives.

> Not sure what you mean here. Are there 2.5 SCSI drives?

Yes, lots. You can ask people with portable Macs.

> Would you happen to know if there is anyway to connect a second
> 3 1/2 disk drive to the Falcon. I'd like to add a standard ST/STe
> type floppy port to the Falcon.

It is possible, but I haven't tried to do this. Never needed two drives.
Easiest should be to press another connector to the flat ribbon cable that
goes to the floppy.

> Do you know if the Falcons monitor port can be used with a monitor
> by its self without any of the Falcon monitor adapters connected?

It can not.

> It would be great if some drivers where created for these devices.

Well, that's the charm of using an Atari, you can do great deeds yourself!
I've thought of making a windows printer work on an Atari, just for the

sport of it...

>
>Why should they ?
>Sharing information is the main reason why newsgroups exist at all.
Exactly the way I feel. Just seems that some folks don't like
questions to be asked about Atari hardware upgrading.

I am very glad that companies like Centek are still creating
hardware/software upgrades for the Atari machines.
Being able to have 128megs of FastRam in a Falcon is a very
big advancment in my opinion. I'm very glad that I was able
to purchase a CT2B. Just hope that the board is good.
I'll know shortly as I'm just about ready to get started. ;)
>
Just need to ask a few more questions. ;)

I've went thru all the documentation that I can find
on the CT2B. Including all at Centeks Web site and
have downloaded all CT2B related software.

I'm a bit confused on Cecile. Most of the documention
I could find on it is in French.

Do I need to install Cecile before I install the
CT2B?

I'm using HD Driver. Do I need to use Cecile at all
with the CT2B?

Any info you can pass along about Cecile is much
appreciated. If you have english docs. I very much
could use them.

Is there any other software that I need to install
before installing the CT2B?

Right now I am using SuperBoot as a bootup manager.
Do you know if SuperBoot works correctly with the
CT2B?

List any other bootup managers that you know works
well with the CT2B.

Do you know if Geneva/NeoDesk will work in all
of the CT2B modes including Turbo?

I notice that NVDI is needed to use the Turbo
modes. Is there any other software accelerators
that I could use besides NVDI?

If I am able to dis-able the blitter in
Geneva/NeoDesk do I need NVDI or etc. to use
the Turbo Modes in TOS 4.0x or TOS 7.0x ?

>If you don't do the mod, then one of the clock signals

>available pixel clocks in turbo modes to 25 or 50 MHz.
>You will no longer have access to the 32 MHz clock,
>as it is this that uses the extra input/output pin.

My 17inch SVGA is not a fixed frequency.
Its a multi-scanning and will accept any signal
within the limits below.
It's scanning Frequency is 30kHz to 70kHz Horizontal
and 50Hz to 120Hz Vertical
Video Bandwidth is 100MHz
Max Res is 1280 x 1024 (Non-interlaced)

Do I still need to do the VGA monitor adapter modification?

>I can say that there is no problem at all in using Midi
>for STinG networking though, which is how I use those
>ports.

Thats good to know. I want to use the MIDI ports for
STinG networking also. ;)

>
>If you can find a suitable connection place to
>get the same signal, then it will suffice to
>bend the pin of the U44 chip so that it does
>not enter its socket, nor must it come into
>contact with anything else that conducts.

I'm a bit confused on this U44 chip.
From what I understand from the installation documentation
U44 has to be removed. Then the docs suggest to break pin
15. And insert this broken pin from the U44 chip
back into the socket and solder wire n10 to the broken pin in

the socket.
Chip U44 is no longer used after you remove it, Right?

Also, I'll probably start out with a 16meg EDO memory chip for the CT2B FastRam. This may seem like a strange question. But is there a wrong way to insert the FastRam memory chip?

And, If you just wanted to try out the Falcon in the standard configuration without Turbo mode. Does a EDO memory chip have to be installed in order for the Falcon to run in standard mode with a CT2B installed?

If, all goes well I'll be starting the installation this week. So any help with these questions asap is much appreciated. And if there is anything you can pass along that I should know before starting out, then please do so.

Thanks for all the help and etc,
phantomm@kih.net

Exiting. What was his gain? 50%?

> I'll repeat the warning though: don't try it at home, one leak would fry
> your machine!!!!

Fear of frying your processor is for whimps! Real men just chance it!

:^)

However, I won't try it for other reasons. It seems mighty cumbersome to me.
And I need both my taps. Besides, visiting females don't find it impressing
to not be able to wash their hands in the bathroom. Or even worse, not being
allowed to completely close the bathroom door because of tubes and pipes
leading to the computer...

On the positive side, there are interesting cooling products for trailer
homes, boats, camping people etc...

Surely there must be some kind of curve of speed gain relative to amount of
cooling. Someone said that an ordinary frigidaire (around +8°C) wasn't
making much of a difference. You at least needed -20°C to make a noticeable
improvement?

Seems that some kind of pressure container with liquid gas would be ideal
for these types of exploits? The temperature would then creep down to
maybe -200°C and great speed increases could be expected.

Maybe this is a product which could be sold to software developers?

"Is your application minus twohundred ready? Will it work with the new 3
gigahertz processors? Would you like to watch your code fly? Try our deep
freeze gas chamber! Where heat is no factor!"

There are no PC programs, but you can get the Marcel word processor,
which is freeware, and will convert 1ST Word files to RTF.

Alternatively, 1ST Word can save as plain ASCII if you uncheck the "WP
Mode" option.

What would you do on an ST with 32Mb ?

TOS will only allow 4Mb, I think you need TOS 2.06 to use 14Mb. You
can't handle more on an ST.

The STE will take max 4 x 1Mb SIMMs, so if you're lucky your 4Mb simms
will be recognized as 1Mb modules, if not, they won't work at all.

On my not modified MSTe the Modem 2 port is the only port that works
without lost charcters above 19200 bps. The best solution is to use
Modem 2 at 57600 for modem connections and with the proper HSMODEM prgs.

Note that some programs (Stalker) will not let you set the right speeds
on Modem 2. This is because the TT Modem 2 has the not so common speed
76800 bps for Modem 2 instead.

>
>The logging onto the internet/BBS should not affect unzipping of files.
>Usually software provides checksums to check the integrity of files,
>using comms packages, using FTP parts of the downloaded file are added
>in order to complete the file (if I've read correctly)!

First check your port and modem settings by downloading with z-modem
from a BBS or local computer with a null-modem cable. When this works
without too many packets resent you can try the Internet. As tcp/ip
(like z-modem) has internal error-checking you may still be able to use
a poorly setup serial port but with lots of packets resent. It should
not be possible though to get corrupted data without any notice. Maybe
the server (the sending computer) is configured for text mode. If so it
will start to add ASCII 13 for every linefeed character it finds. This
is offcourse not so good if the file is not a text but a .LZH binary
file. Usually .ZIP files will be transfered in binary mode but the more
unusual (in UNIX) .LZH .MID etc. may be interpreted as texts. If so
there is nothing you can do afaik.

Dokumentation isnï¿½t good, allows only to install the board.

> Do I need to install Cecile before I install the
> CT2B?

No, cecile driver comes out of the flash while boot up
(and cecile is klicked ON in setup menu)

> I'm using HD Driver. Do I need to use Cecile at all
> with the CT2B?

No, HDDriver works fine if "external driver" in setup menu is klicked ON
- AND - your IDE/SCSI device works well with CT2.
A lot of older drives doasnï¿½t boot correct in turbo mode.

First place: internal original IDE(s) from atari

> Any info you can pass along about Cecile is much
> appreciated. If you have english docs. I very much
> could use them.

Would be nice i can get them too..

> Is there any other software that I need to install
> before installing the CT2B?

DSP_IRQ.PRG into auto folder if you have -NOT- the hardware patch
from didier. (Rev "A" CT2) I doasnï¿½t have a "B" CT2, but i think
needs the same..

> Right now I am using SuperBoot as a bootup manager.
> Do you know if SuperBoot works correctly with the
> CT2B?

Sorry. I donï¿½t know.

> List any other bootup managers that you know works
> well with the CT2B.

Sorry, doasnï¿½t use one.

> Do you know if Geneva/NeoDesk will work in all
> of the CT2B modes including Turbo?

Sorry.

> I notice that NVDI is needed to use the Turbo
> modes. Is there any other software accelerators
> that I could use besides NVDI?

Needs NVDI to switch of the blitter.. :->
and makes the story much faster.

> If I am able to dis-able the blitter in
> Geneva/NeoDesk do I need NVDI or etc. to use
> the Turbo Modes in TOS 4.0x or TOS 7.0x ?

Some other parts also switch the blitter on again..
Must work without NVDI. Blitter -must- allways of.

> Do I still need to do the VGA monitor adapter modification?

Best way. Yes

> I'm a bit confused on this U44 chip.
> From what I understand from the installation documentation
> U44 has to be removed. Then the docs suggest to break pin
> 15. And insert this broken pin from the U44 chip

> the socket.

> Chip U44 is no longer used after you remove it, Right?

U44 here is back into his socked after this "procedure"
Without pin 15, itï¿½s engough to bent it up. Do not connect
pin 15 again to the socked. Thatï¿½s all. Pin 15 on socket only
holds the wire from CT2.

> Also, I'll probably start out with a 16meg EDO memory
> chip for the CT2B FastRam. This may seem like a strange
> question. But is there a wrong way to insert the
> FastRam memory chip?

Have a look to the simm! Simm board only can insert in one direction.
With wrong direction the simm doasnï¿½t snap in.
Use a EDO with 8 chips and a "9" on boards no. "5" doasnï¿½t work well.

> And, If you just wanted to try out the Falcon in the
> standard configuration without Turbo mode. Does a
> EDO memory chip have to be installed in order for the
> Falcon to run in standard mode with a CT2B installed?

In normal mode the machine doasnï¿½t access fast ram, so i think
it will work without the EDO. Not tested. Iï¿½m not sure.

Regards, Robert

Is this when your trying to access a CD Rom?

If so it could be a faulty CD Rom.

Try a different one.

Another thought is that you may not have installed it correctly, try
instaling it again with the install program, and make sure you set it
to look for the CD Roms ID number.

Sorry I can't help with the Syquest, as I never got one of them
working here, and gave up on it as the 44 meg cartridges are way too
expensive for the size of them.

If memory serve me correctly, you can edit the maps from an
unregistered version, but it will onbly display routes that fall
within a 200 mile limit.

I don't know if it is still supporteed though.

...
>>If you have a printer driver you want to use, surely you must also
>>have the GDOS it was supposed to work with?
>
>No. It has worked fine using old drivers with NVDI.

What I meant above was only that you wouldn't normally have a GDOS
driver but no GDOS it can work with. Therefore, you will be able to
use your printer when having fVDI installed, even if fVDI itself can't
deal with the GDOS driver.

>>Has anyone except the NVDI developers written any printer drivers the
>>last few years? _Is_ there a 'standard' for this available anywhere?
>
>I am not well informed on that, but if there is not a standard, then

There must certainly _be_ a standard. The question is if it's _available_.

>Good. As NVDI has gone quite a bit beyond the normal VDI and GDOS versions
>for many things, I think that many will want precisely this combination,
>using fVDI only as a screen driver, and NVDI for all the rest.

For now, people who already own NVDI may want to use it as foreground VDI
so that they can still get their vector fonts etc on the screen.
I fully intend to eventually support all (as far as that is possible)
the NVDI additions in fVDI.

>It really would be unnecessary duplication to invest a lot of work to make
>fVDI into a replacement for all the things handled by NVDI.

Not in the long run, and not for some potential uses for fVDI.
For example, I intend to make fVDI usable under MacMiNT and (obviously)
the Fenix OS. Ports to one or more Atari emulators and the Tempest (in
PPC mode) are also very likely.

>No, I realize that, and I suspect that it might be better to make a definite
choice of how fVDI can and must cooperate with NVDI and/or other GDOS. That
>might help in making some implementation details simpler and more consistent.

While it would indeed do that, I personally don't like the performance hit.
It's certainly easier to have fVDI in the background, but on my AB040
with an Eclipse/RageII that means about three times slower text output

according to GEMBench, if NVDI is in the foreground. The other GDOSes
would be a lot slower than that.

>>It is (or rather will be) a full GDOS replacement (not necessarily
>>driver level compatible), but that's of little use without drivers.
>>Those drivers will not appear until/unless someone actually writes them...
>
>But that is precisely where 'fallback' compatibility with old drivers can
>help some. Then only drivers for new stuff need to be developed.

Yes.

>Possibly I misunderstood you earlier. I suppose I shall have to experiment
>a bit with the current fVDI to fully understand some of your points.

Please, let me know if you run into any problems.
The easiest way to experiment with fVDI is to run it from the desktop.
You can then shut it down whenever you like.

The very latest beta version (uploaded today) can now fill polygons.

>I see. Actually you might want to consider other call methods than the
>normal subroutine linking and register stacking. They are good for the
>purpose of making generic consistent interfaces, by standards implemented
>for most C compilers etc, but they are not very efficient.

True, but I don't think it's much of a problem, really.
Doing things pixel by pixel will be slow no matter what, and most other
functions need all of the registers anyway, and do a lot of work.

From: jovlie@xs4all.nl
Message-ID: <7k42hjimt2@news1.xs4all.nl>
Source record: 77283

Hello,
Some time ago I bought a Sigma Designs Page View monitor, monochrome
in brand-new condition, only without drivers or videocard.It's
modelnr is PVM 001500A.I would like to use it, preferably on Atari
but if that's impossible on a PC.
Is there somebody who knows something about this bizarre monitor
Any help is appreciated.
On the monitor was a paper-sticker with the name of the firm :

Borsu Systema, Lelystad, the Netherlands
Jos Vlietstra
Second question :Is there somebody who can print the homepage of
www.tagesschau.de with an Atari/Cab 2.7/NVDI 5.1/MagiC 5.2/HP 400
colourcartridge ??
I don't get this printed.....my brother with his Pentium does quite
well...

601. TAF Meeting June 16th - Mario's Marvels!

Newsgroup: comp.sys.atari.st
Date: 1999-06-14 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3765ae34@nemo.idirect.com>
Source record: 77284

Agenda for the June 16th, 1999 meeting of the Toronto Atari Federation:

As your classic Atari ST/TT/Falcon gets older, you may find that certain parts of your system may need replacing. Is your mouse getting tired? Has your mono monitor faded to black? Has your SH hard drive spun down for the last time? Where am I going to find replacements?

At this particular meeting you'll find the perfect solution to these questions, as we'll be showing off and doing demoes of three products done by the young New Zealand genius Mario Becroft that solves these problems nicely!

Astound! at the sight of attaching a PC three-button mouse to your ST via the Mouse Adaptor and make it perform double-clicks with one click of the central button! (Also makes a great gift for Amiga users!) Thrill! at getting a nice clear SVGA monitor screen via the VGA Adaptor - mere plug & play! AND! Prepare for the biggest surprise as we show you how to put a notebook IDE drive INSIDE your ST/STe's case via the new IDE Adaptor (which also opens some interesting possibilities - how about putting an iMation SuperDrive inside your ST for starters?)

If you've been worried about replacing mice, monitors or hard drives, this meeting is a MUST-ATTEND spectacle of technological marvel! See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

TPUG AND TAF JOIN FORCES FOR A DAY OF EXCITING BARGAINS IN TORONTO!

The Toronto Pet Users Group (THE support group for users of Commodore's PET, VIC 10/20, 64 and 128, and the Amiga) and Toronto Atari Federation (North America's largest user group for the Atari enthusiast) are holding a joint Flea Market at the Alderwood United Church, 44 Delma Drive in Toronto, Ontario, Canada on Saturday June 19th from 11:00 a.m. until 3:00 p.m. If you own any of these classic computer systems and have been looking for hardware or software, or you have systems or software that you'd like to sell, now's your chance. Sell your old stuff, go home with a treasure!

The days of rivalry between the two competing systems are over, and users of both these platforms realize that it is better to cooperate rather than to butt heads. And indeed, with the Amiga's strengths in audio and graphics, and the ST/TT/Falcon's strengths in MIDI and DTP (not to mention the fact that both platforms make excellent and cheap machines for getting on and making use of the Internet) there is much that can be learned and shared between the two platforms by their respective users.

TAF will be there with copies of ST+ Fanzine for sale and with a number of Mario Becroft's excellent new products for adapting PC serial mice, VGA/SVGA adaptors and internal IDE drives to Atari STs (the Mouse Adaptor also works with the Amiga, so if you've got an Amiga with a dying mouse here's your chance to use one of the many excellent two and three-button mice available to the PC with your system), as well as info on how to join TAF.

It's going to be an exciting summer - and this will be the event to kick it off! See you there!

> public(FREE). MY TT with ICD utils has decided not to let me in and my
> floppy has died:(.

Don't believe Supra and ICD has released any free programs, but you could
try AHDI from Atari Corporation. Get it by surfing to:

http://sunsite.doc.ic.ac.uk/public/pub/computing/systems/atari/umich/Diskuti
ls/

And choose:

ahdi6061.lzh

If you own a legal copy of ICD utilities you can of course ask someone to
copy a backup to you.

There are other alternatives -- the IMG format originated from the PC --
but you could try the 'Viewer/Xnview' utilities, which supports that
format and even allows for Atari-specific conversions (Degas, Tiny,
Spectrum, Neochrome). Binaries are available for Atari, MSDOS, Windows,
Linux, FreeBSD and Irix. In your case use the utilities' XNVIEW
interface for Windows:

>can't remember where I found it, I've uploaded it to Demons FTP site.
>It should be in the Atari file list in a few days.

Thanks for putting this up on Demon's FTP server: I'll go and have a look.
I've had a utility called 1WP2RTF for a while, from the Sunsite Umich
mirror:

http://sunsite.doc.ic.ac.uk/public/Mirrors/atari.archive.umich.edu/Applicati
ons/Wordproc/1wp2rtf.zoo

This doesn't have a PC executable though, so even if it's basically the same
thing your archive is a lot more useful!

Cheers,
John

I think the biggest problem is finding software that will work with whatever BBS software you are using. (and if its even still supported?) It is hard these days. I think Octopus is still supported, but aside from it, is any Atari BBS software still officially supported? I use BBS Express! ST and it was supported up to this year, when the author made a cross-country move and had stated that further support was up in the air. I purchased Ratsoft v2 once, and never ever got a reply from the author. ($99 too!) Oh well...

Personally, I'm still working on linking my TT and Mega ST to make my BBS available via Telnet. Its a long, hard (obstacle ridden) road though... ;-)

Later...

I think that feedback is take on output so I you have C11 or C12 wear out
by heat or 'high' frequency, voltage at output of transformer increases and
voltage of 12V output increases (no feedback for 12V !).
You PSU is removed, maybe you can made test...

>On my PSU the +5V output was correct all along, and it is only the +12V

My +5V was always good...

>output which is incorrect, so I guess our problems are not really the same.

I'am sure at 75% that is the same problem, at factory we have some problems
with capacitors (heat or 'high' frequency is bad for this type), and not only
on PSU.

> (It is certainly possible at the STinG end though.)

You're not the first one to think of this ;-) I have been thinking of writing packet-drivers for STiNG and MiNT-net (XIF, not XDD) that use a block of shared memory to exchange packets, mostly to be able to use STiNG's IP-masquerading. However, with the recent development of IP-masq. in MiNT-Net I no longer have any need for this.

As for the Riebl-card, there are drivers for it (inc. source) in the MiNT-Net distribtion, so it shouldn't be hard to set it up. The problem is (as M-E indicated) the Riebl's hardware-address which might be lost. I'm afraid I can't be of any assistance in this case, as I don't have a Riebl myself.

>> with such cooling, allowing much denser storage.
>
>Cleaver. Heard any news from the norwegian project where a new type of
>(crystal array I think) memory without moving parts is being developed?

No, I haven't heard of that, but I have heard rumours since waaayyy back
(on the order of a decade) about experiments in using crystalline grids
to store data in a three-dimensional matrix, using only a few molecules
per cell. So far these have failed to be result in practical solutions,
and this is probably due to the obvious problems of accessing the cells
internal to such a structure and reading/writing data, without ever
affecting any intermediate cells.

>A unit the size of a matchbox could hold some 20 terabytes of RAM.

Sure, with each cell being a tightly bound molecule group in a crystal
grid, such densities are quite possible. The difficulty lies not in
achieving the cell density, but in ensuring safe reading and writing.

A write-once ROM media would probably be easier to achieve, writing the
data from inside to outside by intense laser beams that would permanently
change the grid cells so as to fix them in the programmed state. Each
of the beams should be incapable of causing this change, so that it only
occurs where two beams intersect, and with the state chosen by their
polarization.

Then readout could be achieved by precise focusing of weaker laser beams.

>Reminds me of the modules in HAL in the movie 2001.

Well, he did have the script writer on his side, something that our computers
usually can't count on ;-)

>Apparently no mentionable heat dissipation and no current consumption to
>speak of.

That remains to be seen. In theory CMOS was also supposed to draw no current
to speak of, but today we know that's only true at very low frequencies. At
top frequencies it draws even more current than corresponding TTL.

>Access rates much below today's and the data stays until you actively change
>it. Will hopefully replace both RAM and magnetic media?

It could, eventually. The ultimate 'solid state' media without moving parts.
(Moving parts being the nemesis [in original sense] of all storage systems.)

>> At really cool temperatures, like 40 degrees kelvin , those effects are
>> extreme of course, since normal gases can then be fluid or even solid.
>> All components would have to be specially designed for surviving at

>
>Maybe we've flipped out too far,

Sure we have, but that never hurt any before ;-)

>since the discussion was about how to cool this CT2 of yours?
>Only fast and cheap way I can think of is bigger heatsinks and more fans.

Actually I find my current setup acceptable, using extra fans, external
keyboard, and external PSU. I think I'll stay with this solution until
I eventually get some kind of tower box.

At least the current setup allows all CT2 modes to work properly, which none
of the earlier I've tried could do.

610. Re: 1040 STf <--> CAB?

Newsgroup: comp.sys.atari.st
Date: 1999-06-15 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.990615182231.17701A-100000@halifax.chebucto.ns.ca>
Source record: 77149

I am using the newest CAB_OVL designed for STinG according to Ronald. I am attempting just to get it up and running so I am pointing to a very basic html page I created that resides on the A: floppy disk along with CAB 1.5 becasue it will crash if pointed to an online site right away.

I went through all the settings and made sure everything is pointed to the A: drive which is where I am attemtping to run it from. STinG connects fine and the PPP connection is made but when I insert the floppy with CAB 1.5 and click on it, it brings up the menu bar at the top but before it shows the button bar, it shows 3 bombs and goes back to the startup screen showing the floppy disks.

I want to get this working as many of our club members only have 1040's and I would like to offer support to them for PPP connections.

Thanks...

Here is a list of Atari software that I still have for sale.

Software with original disks and documentation:

Antic Software:
Star Struck the astrologer (will load and work from a hard drive)
Maps and Legends the Cartographer (only runs on old TOS)
Data Map Collection 1
CyberPaint (Pro Animation Studio) from Antic Publishing, Inc.

CAD-3D (version 1.0) [all 3 resolutions]
Human Design Disk (Requires CAD-3D)
Genesis - The Stereo Molecular Modeler (StereoTek Option)
Future Design Disk (Requires CAD-3D)
Fonts, Primitives, Hints and Tips (Requires CAD-3D version 1.0 or 2.0)
3D Developers disk for CAD-3D 2.0
Architectural Design Disk by Darrel Anderson (Requires CAD-3D)

Flash STO220 by Joe Chiazzese and Alan Page (telecommunication package) [medium and high resolution]

The New Technology coloring book (low resolution only and only works with the old TOS)

GFA Artist by Michtron
First CADD by Generic software

WANDERER by Pyramid Software includes two (red/green) stereo glasses.
1st Word with manual (versions 1.01 and 1.02)

Fahrenheit 451 by Ray Bradbury (Telarium)

HabaWriter (reported to be the worst word processor ever for the ST!) It ran properly on my system!

Thunder! spelling checker (Batteries Included) for word processors without a spelling checker. Works better than the spelling checker in 1st Word plus

Oo-Topos for Atari 520ST by Polarware (missing the ships map)
The Crimson Crown (further adventures in Transylvania (Polarware)
Temple of Apshai Trilogy by Epyx
TASS TIMES in Tonetown (Activision
Hacker II the Doomsday Papers (Activision)
Mercenary (Datasoft)
Silicon Dreams (Firebird)
Jewels of /Darkness (Firebird)
Flight Simulator II (Sub Logic) only runs from disk
Revolver (Intersect Software) load two or more programs on a 4 meg system.

I've been following this thread some.
Interesting reading. ;)

I think someone here was having trouble keeping a Falcon
Cool enough to run a CT2B.

If the falcon is in a standard case, would it help to
raise the falcon up off the desk or table a few inches?
This should allow some air to move underneath.
The bottom Fan would probably cool better.

How about using some of those old slanted printer
stands. Those would set the back of the Falcon up
while leaving the keyboard down. Like a sports car. ;)

I know heat rises, but If I put my hand under my desk
where my Falcon sits, especially around the PS it's
pretty warm.
The motherboard bottom shielding probably acts like
a big heatsink anyway.

Just a thought.

I have a GoldenImage Master 3S that I use on a STe.

Pin 1 is +5vDC 400MA.
Pin 2 = Ground
Pin 3 = Ground
Pin 4 = NC

.3 .2

.4 .1
*

The above is the diagram that is shown on my powersupply.
The * is the notch in the connector.

Hope this helps,
phantomm@kih.net

621. 1040 STf <--> CAB?

Newsgroup: comp.sys.atari.st
Date: 1999-06-15 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>

Is there a version of CAB that will run on a 1 meg 1040 STf along with STinG 1.20.

I have STinG running on it but CAB 1.5 bombs (with 3 bombs) every time.

Thanks...

Paint Shop Pro can read some of them. If not, you'll have to convert
them on a real ST or on an emulator.

I have the following for sale:

1 Atari 520STe (upgraded to 4MB) with 270MB Hard Drive, & SM124 Hi-Res Monitor. Dot Matrix Printer, external floppy drive.
Comes with all the software I have (mainly music stuff). The whole lot must have cost me somewhere in the region of £800 so
offers start at £175 .

Please don't reply to this posting but send e-mail to:
zorg99@connect4free.net
Thanks,
David.

I have also heard (but please verify this before doing so) that when using a CT2, the fan should be reversed to make the overall cooling better, in combination with the CT2 fan.

I have a refreshing problem with my Falcon though.. it's in a Mega STe case, and apparantly my CT2 doesn't work very well when it's.. cold. :) When I switch on my Falcon in turbo mode and boot MiNTos, I have to reboot about 20 times because of random buserrors during bootup. When it's been running for like two days and I reboot, it usually works in one go. This sounds like a bad joint which becomes better when it expands because of the heat, so the moment I can miss my Falcon for a few days I'll take it back to the dealer who put in the CT2. Also my audio doesn't work in turbo, so something's definitely wrong with mine anyway.

As for the cooling in my mste cased falcon, if anyone is interested: The bottom fan is pretty useless since there's no opening below it, but I have an external power supply and the whole top side of the case is free (I didn't place my monitor directly on top of the case but I put up a little shelf a few inches above it). And since I leave my MiNTos running Falcon up for weeks now and then, seems to be ok. :)

Maurits.

I can answer Roberts doubt, the rev.B still has the same DSP IRQ "bug" as the rev.A version, simply because Centek has principal objections against using this signal. I guess I can agree with them, but they should stop claiming that the Falcon with CT2 switched off is 100% compatible with an original Falcon, because it's not. An original Falcon allows the software to read the DSP IRQ signal, no matter how dirty this is.

Maurits.

I don't know about colour, I only use B/W on a HP510, but printing from CAB 2.5 and NVDI 4, with or without Magic, is very good, full graphics and limited only by the printer resolution. A full page - graphics and all - in about one min. Hasn't NVDI 5 had a mixed review and haven't I seen various postings advising to stick with 4?

Bob king.

>Why then would it work on the Falcon in lower case?

Probably because the Falcon GEMDOS has been altered since the ST TOS you
have was produced. One of the things that have changed in later years
is how filenames are 'cased' internally by GEMDOS.

STING just passes the path string exactly as found in the file to the
GEMDOS functions used to search for DEFAULT.CFG and the STX modules.

If the GEMDOS used does not 'like' your lower case characters, that
simply means you must stick to upper case characters, and using those
should work with every TOS.

>
>In the Pacifist Ini file where you can change what it does it says
>
>Ram=32
>
>But still only gives me 14Mb does any one know how to get around this.

I know nothing of Pacifist, but I do know a lot about TOS memory maps.
All standard TOS require that ST-RAM start at $00000000 and the TOS
starts either at $00E00000 or at $00FC0000, and in both cases the area
between $00E00000 and $00FFFFFF is reserved for non-RAM purposes.
(cartride ROM, TOS ROM, memory mapped hardware registers)

This means that the normal ST-RAM area can never exceed 14 MB in size,
and any further memory added must be in another separate area. For any
such RAM to be added you need a very modern TOS, or some TOS enhancement
that implements the needed functions.

I believe these things go outside of what Pacifist can currently do,
though I don't really know that, not being a Pacifist user myself.

One reason why I believe Pacifist can't do it is because AFAIK it will
only emulate a 68000 CPU, and that CPU only has 24 address bits. Thus
there is no physical address range free for any more RAM than 14 MB,
since the total address space is only 16 MB, whereof 2 MB are reserved
as described above.

But was that fan small enough to fit below the keyboard at the right side
of a CT2B board ? If so, then the parts number would be interesting.
(But I guess it may not be produced now, as you said 'old tapestreamer'.)

----- snip ----- re: cooling is difficult in so enclosed an area
>
>The important thing is to lead the heat away from the chips. If the heatsink
>or air around the daughterboard gets hotter is of secondary importance.

The efficiency of a heatsink is dependent on the air temperature. If the air
does not circulate at all, and the case is thermically isolating, then in
time the entire heatsink will reach the same temperature as the internal IC
substrate. At that point the heatsink will stop having any effect at all,
as heat is not transferred between objects already at the same temperature.

In reality such perfect isolation is not possible, and some cooling effect
of the heatsink will always remain, but not sufficiently to allow me to use
the CT2B safely without a fan-driven airflow for cooling the ispLSI chips.

>Of course, the cooler the surrounding is, the sooner is the heat transported
>away from the chip...

It is not just a matter of time. As the heat of the heatsink rises, the
temperature difference at its junction to the cooled object lowers, which
lowers the amount of heat transferred. This is much like how the current
through a resistor decreases as the voltage over it drops, with voltage
representing temperature, and current representing the cooling.

In fact that is the kind of model used by those who design heatsinks.

>> Yes, I can see how it would, but heatsink cooling requires some freedom of

>keyboard.
>
>Seems you'll have to find some kind of tube, like in aquariums, and pump the
>air around with that?

Something like that could indeed work, but it would take some large hardware
modifications to install such a cooling system. I don't think I'll bother.
I've already gotten used to placing a MegaST keyboard on top of my Falcon
and using that instead of the internal (now removed) keyboard.

----- snip ----- re: on cooling with fluid inert gas
>
>Another way is finding a deep cave with constantly low temperature and an
>ethernet connection...
>
>:^)

No good, I'm afraid. :-)
It is only my computer that likes it cold. I myself don't.

>No seriously, this cooling technique your're mentioning sounds promising,
>how available is it for hobby purposes?

At hobby prices, not available at all.
This is used only for supercomputers, available at very high cost.
A normal computer could not survive this kind of cooling anyway.

----- snip ----- re: supercooled gases also cause superconduction
>
>I wonder what the cost would be (in watts) for such a system to work with
>one enclosed motherboard?

In fact, the continuous power cost of a perfectly enclosed board is very low,
and if leakage is fully eliminated will get close to nothing. The reasons are
that superconducting switches (ie: transistors) do not dissipate any power at
all, so the only power dissipation will be in purely resistive components.
Simple pullup and biasing resistors will still have their normal consumption
of V*I, of course, but those are only a small part of the normal dissipation,
most of which will simply cease to occur at superlow temperatures.

>The diskdrives and harddisks should be left aside for such an experiment,
>since the mechanical parts would shrink enough to cause great problems.

Indeed, and magnetic fields do not behave normally at such temperatures.
Actually this could be used to design special media that can only work
with such cooling, allowing much denser storage.

>Best would be to split the computer into two parts, a "not-so-hot" part and
>a "needs-much-cooling" part.

Probably, yes.

>But that would in fact mean a new development of a motherboard,
>daughterboards, etc.

It would. At such temperatures many materials are completely useless,
that we take for granted using at normal temperatures. Most materials
become very hard, but also very brittle, so that they can shatter easily.

People who have visited 'Norrland' in midwinter should know exactly what I'm talking about as some of these effects are clearly visible even at the (relatively) warm temperature of minus 40 degrees celsius. (Which occurs there every winter.) Things made of plastic, for example, often simply don't work as they should at all then, breaking at the slightest load or pressure.

At really cool temperatures, like 40 degrees kelvin , those effects are extreme of course, since normal gases can then be fluid or even solid. All components would have to be specially designed for surviving at such temperatures.

>Sorry :-) in french it's condensateur... I can't verify all words.

I realize that, and since I am not english myself I had no problem knowing
what you meant. Actually I think that the original english word was once
'condenser', but nowdays the proper english form is 'capacitor'.
(Probably to avoid mixup with steam technology (honestly... :-))

>>My PSU is one made by 'Skynet Electronics' in Taiwan. Was yours the same ?
>
>I don't know, I can verify if you want (my falcon is closed ;-)).

No, it is not that important, as your description matches my PSU anyway.

>On my PSU I can found 3 x 1000 uF at right of transformer, and specially
>2 x 1000 uF side by side (and in //) near outputs. One of them was bad
>(traces visibles to the naked eye on this condenser and PSU card). I have
>replaced 2 x 1000 uF by a big 2200 uF because I havn't found the same voltage
>(and size !).

On my PSU there is no visible damage to any traces at all, so I doubt if this
is the same problem then. Also, all three 1000uF capacitors are connected to
the +5V supply, although one is separated from the other two by an inductor.

Partial schematic:
D2 L2
Switch spikes X----|>|---+----+---))))))---+----------X +5V
| | |
Transformer C11 === === C12 === C13 PSU outputs
| | |
Switch ground X----------+----+------------+----------X Ground

NB: The above excludes some of the feedback circuitry from output.

Your correction appears to be replacing the C11//C12 combination with a
new capacitor with appx the same total capacitance, which is equivalent,
but should have nothing to do with the +12V output.

On my PSU the +5V output was correct all along, and it is only the +12V
output which is incorrect, so I guess our problems are not really the same.

The funny thing is that I have two Falcon PSUs, both of which give perfect
+5V and incorrect +12V. But one of them gives +18V and the other gives +6V
which shows that this voltage can err in either direction, even though the
main +5V regulation works fine.

>update my card for this problem only.

Yes, that would serve no real purpose, unless you find some software that
requires the slower clocks to run in compatibility mode. But I think most
CT2 owners will drop software that demands compatibility mode anyway, as
that will be so much slower than we are used to.

>I have also talked to Centek this MMU patch (bus error for acces to
>adress < $800 in user state), I hope an update of setup for remove
>my patch in auto-folder...

That would be much more meaningful. Especially as such updates are made
in Flash ROM, so that there is no need to send the board to Centek.

I was not really telling you to disregard manufacturer instructions,
but merely saying that I had to do so to gain satifactory operation.

>>Wise decision ! The heat sink is *definitely* needed regardless of fan.
>
>Is your heat sink square or round?

It is round, and glued 'off center' on top of the CPU

----- snip ----- re: my cooling fans
>
>Hmmm..The CT2B must generate alot of heat?

All high speed complex circuits generate heat, that is unavoidable,
but the real problem is that the ispLSI circuits are quite sensitive
to this selfgenerated heat, and will give incorrect signal generation
if not cooled off sufficiently.

That is why I find it so surprising that no effort has been made to
cool them in any way at all. Only the CPU is cooled, and it does not
need it half as much as those ispLSI circuits do. It does need some
cooling too, so the heatsink is warranted, but such should also have
been provided for the ispLSI chips, and the fan should be mounted as
described by Didier in other posts. So that both the CPU and the
ispLSI chips take part of the cooling effect.

----- snip ----- re: my use of an external keyboard (from MegaST)
>
>ok, I have been thinking of using a different type of Atari
>keyboard. One thing I'm not clear on.
>Does the MegaST, MegaSTE, and TT keyboards have mouse and joystick
>ports in the same location as the Falcon?

The Falcon has the connectors on the underside of the right corner closest to the user, which is ok for an internal keyboard. That would be totally unacceptable for an external keyboard, as that should be able to lie flatly on any flat surface (when back 'legs' are folded in).

Instead the MegaSTe and TT keyboards have one connector at each end of the keyboard assembly, thus increasing the width of the space needed for such a keyboard by appx 10cm (5 on each side). This is a solution I don't like.

The MegaST keyboard on the other hand has 'hollows' in the back edge of the keyboard case, containing the connectors. The total width needed for this keyboard is less than half a centimetre more than the width of the Falcon, which is why it fits so well on top of my Falcon. This is a good solution.

>>Yes, many ways are possible, but which will work best is unknown.
>
>After I get the CT2B installed and working correctly, I'll try
>some different things and will let ya know the results.

Ok. It is always useful to 'pool' our experiences.

>>That will definitely require some 'tower' solution, rather than using
>>original Falcon case.
>
>Sure wish someone would dig a good case out of their closet and
>sell/trade it to me. It would be a big help. ;)

I believe some dealers still supply tower assemblies specially made for the Falcon, but these do not come cheap.

----- snip ----- re: the dangers of increasing CT2B connection cable length
>
>I'm going to try and leave them long and add extra insulation to try
>and keep EMI and etc as low as possible.

Unfortunately high frequency radiation ignores insulation. Only shielding can stop it, and that will impose capacitive loading, so even that can not be applied in some cases. It will probably be okay to use barely sufficient extra length to allow for one low board below CT2B, but not much more.

That should work because this is how Centek's expansion bus connector must have been installed (as discussed in earlier posts).

>>That should mean an improvement factor of 50/32, which is +56.25%
>
>That would be a big increase! ;)

True, but it is nothing compared to the speedup you can expect if it does work with FastRAM as well. That would be really impressive !

>>Maybe so, but there is no telling how this relates to CT2.
>
>Don't know if having support for the Nemesis and AfterBurner
>would help or not with the CT2B.

AB support code can contain 68040-specific coding, so if that is the case
then it will definitely not work right with a CT2. Nemesis stuff should
not have that problem, but I don't know if it can help any either.

>If the support for these would cause problems. Then I do
>have my back ups of the Apex before support was added.
>
>I'll try both versions and see if there is any difference.

Good.

>I try to contact Doug asap, and ask him about it.
>He has always been very helpful to me and is a excellent
>programmer. Hopefully he will want to add support for the CT2B
>if needed.

That is good, but best of all is to find generic solutions that will
work well independently of what accelerator (if any) is used.

>>Why should they ?
>>Sharing information is the main reason why newsgroups exist at all.
>
>Exactly the way I feel. Just seems that some folks don't like
>questions to be asked about Atari hardware upgrading.

Then they should stick to other newsgroups, because this is the main
newsgroup for all things concerning atari machines in general.

Perhaps some of the things discussed here in 'csas' would really fit
better in 'csat' instead, or even 'csap' (for debates on programming),
but often queries that lead to such discussions are started here and
moving the threads later only adds confusion.

>I am very glad that companies like Centek are still creating
>hardware/software upgrades for the Atari machines.

Indeed, they and all others like them. It is a pity that some,
even amongst those companies, regard all other equipment on the
same platform as some kind of enemy. This is something we can
not afford to do on a platform with so 'narrow' support as ours.
We must cooperate across all in-platform borders.

>Being able to have 128megs of FastRam in a Falcon is a very
>big advancment in my opinion.

It is, though I only have 32 MB myself for a fact, and see no
need of any more in the near future.

>I'm very glad that I was able to purchase a CT2B.

So am I, despite my descriptions of problems I've had.

>I've went thru all the documentation that I can find
>on the CT2B. Including all at Centeks Web site and
>have downloaded all CT2B related software.
>

>I'm a bit confused on Cecile. Most of the documention
>I could find on it is in French.

They are a french company, and only a few of their staff
are proficient in english. Most of them can only barely
make themselves understood, even in simple conversation.
I do not expect english docs for Cecile or Centinel in any
near future unless some outsider translates it for them.

>Do I need to install Cecile before I install the
>CT2B?

No.

>I'm using HD Driver. Do I need to use Cecile at all
>with the CT2B?

No, unless you are very unlucky with your IDE drive.

The only reason to use Cecile that I know of is for those
users who need to use the special feature of Cecile to use
variable access delays for IDE drives.

My drive does not need that feature, so I stick to HDDriver.

>Any info you can pass along about Cecile is much
>appreciated. If you have english docs. I very much
>could use them.

Sorry, I don't have any.

>Is there any other software that I need to install
>before installing the CT2B?
>
No, there is nothing you need to install on your system before
you do the physical installation, because anything you do want
can be added afterward as well. When the SPDT switch is set
to compatibility mode, the Flash ROM is not used, and the boot
will proceed as for a normal Falcon, with all clocks at normal
speeds. There are some slight differencies even then, but they
are not any hindrance in using the system as normal.

The only extra patch program I use in \AUTO\ now is FALCT2_8.PRG,
which replaces the old FALCON8.PRG in adapting CALAMUS to the
256-colour resolutions of Falcon. It has no other purpose.

You will also need the DSP_IRQ.PRG in \AUTO\ to allow programs
that use DSP interrupts to work correctly. Note that most of
the programs that use DSP do *not* use those interrupts.

To boot in TOS 7.x 'full turbo' mode you will need NVDI, so that
the hardware blitter can be turned off, as it is not compatible
with the use of FastRAM.

At least that is what Centek claim, but I think they misinterpret
the true meaning of the symptoms. If they were correct, then the
blitting should never fail when FastRAM is not active, and it does
fail then too, and quite frequently.

The simple truth is that even without FastRAM the blitter implemented
in the Falcon is not reliable when those chips are clocked at 50 MHz.
That is the reason why all boot managers have problems, even when
booted in TOS 4.x mode, where no FastRAM is active.

I am convinced that this problem could be fully fixed simply by using
slightly longer access delays in writes to some blitter registers, as
the blitting errors always appears in patterns indicating that some
blitter register are using the wrong source or destination address.
But such a change requires reprogramming of the ispLSI chips by sending
the board back to Centek, when/if they develop such a fix.

>Right now I am using SuperBoot as a bootup manager.
>Do you know if SuperBoot works correctly with the
>CT2B?

I do not know that, as I never used it.

>List any other bootup managers that you know works
>well with the CT2B.

XBOOT is the one I use myself, but even it does not work perfectly.
Some operations, such as slide-scrolling the selection windows can
frequently cause problems, so I always use click-scrolling instead.

STOOP is what I used before CT2B installation, but it does not work
well at all in the turbo modes. This is probably because it uses a
lot more blitting than XBOOT does, thus invoking the blitter problem
described further above.

>Do you know if Geneva/NeoDesk will work in all
>of the CT2B modes including Turbo?

I don't have NeoDesk myself any more, but it should work in FastRAM
too, as it should be TT-compatible. But in any case, there should
be no problem in disabling its FastRAM flags if it does not like to
use FastRAM.

I am sure Geneva does work.

>I notice that NVDI is needed to use the Turbo
>modes. Is there any other software accelerators
>that I could use besides NVDI?

The main problem is that Falcon TOS does not allow the commands that
are used on other TOS machines for turning blitter off to have effect,
since Falcon (alone of all TOS machines) does not have any software
blitter built in. That was a very serious design mistake.

NVDI fixes that by implementing a software blitter and allowing the
hardware blitter to be turned off. (But it does not force it off !)

It is very probable that MagiC contains a similar software blitter,
as the VDI of MagiC was written by the same authors as wrote NVDI.
(The Behne brothers.) But I see no reason not to use NVDI anyway,
as the VDI of MagiC is still just a VDI, not a full GDOS.

>If I am able to dis-able the blitter in
>Geneva/NeoDesk

You are not able to do that, as the blitter control function of Falcon
TOS will ignore the argument and always enables the physical blitter.

I actually have disassembled the code to see how this works, and there
is no way around it except by installing a full software blitter, and
then replacing this blitter control function as well. The only software
which I know does this correctly is NVDI, but it is possible that other
VDI contenders (eg: fVDI) can do the same.

>do I need NVDI or etc. to use the Turbo Modes in TOS 4.0x or TOS 7.0x ?

Yes. Although TOS 4.0x may work partly without NVDI, there will still
be recurrent problems (see further above) as long as blitter is active
with either turbo mode.

----- snip ----- re: fixing the monitor adaptor to get 32 MHz pixel clock
>
>My 17inch SVGA is not a fixed frequency.
>Its a multi-scanning and will accept any signal
>within the limits below.

That is good, but even with a multi-scan monitor you have greater freedom
in how to design a resolution if you have access to more pixel clocks.

>It's scanning Frequency is 30kHz to 70kHz Horizontal
>and 50Hz to 120Hz Vertical
>Video Bandwidth is 100MHz
>Max Res is 1280 x 1024 (Non-interlaced)

The last width is nonsense, as it refers to some standard pixel rate on
some other equipment (probably PC). If you use a high pixel clock, and
a slow horizontal scan, then you can get a lot more pixels if you want
them. The problem is to maintain a readable display, with small icon
fonts (and other objects), and to maintain neat picture proportions so
that no pictures are distorted (the 'square pixel' problem). Having
another pixel clock available can really help for these things.

On the monitor size you refer to I would recommend no higher resolution
than what I normally use myself on my 19inch screen, which is 960x720.
I can use 1280x960 too, but then icon fonts get unpleasantly small, and
for a 17incher this may already be the case at 960x720. That's up to you.

>Do I still need to do the VGA monitor adapter modification?

That is not for me to say. If you want the added freedom of another
pixel clock, then you must do it. If you don't want it you can skip that,
but then you must disable this output signal from the CT2, and save that
setting in its NVRAM.

>>I can say that there is no problem at all in using Midi
>>for STinG networking though, which is how I use those
>>ports.
>
>Thats good to know. I want to use the MIDI ports for
>STinG networking also. ;)

Good choice. (That response from me will hardly surprise anyone ;-)

----- snip ----- re: modifying the GAL chip U44
>
>I'm a bit confused on this U44 chip.
>From what I understand from the installation documentation
>U44 has to be removed. Then the docs suggest to break pin
>15. And insert this broken pin from the U44 chip
>back into the socket and solder wire n10 to the broken pin in
>the socket.
>Chip U44 is no longer used after you remove it, Right?

NO !!! That is completely wrong !!!

U44 is vital to correct functioning of your Falcon even with CT2B.
It is only pin 15 of that chip which is to be disconnected, and the
signal must then be delivered by the appropriate CT2B wire instead.

I carefully inserted that wire into socket hole 15 of the U44 socket,
so that the insulation was 'flush' with the socket edge, and equally
carefully soldered it to the connector in that hole, taking great care
not to 'burn away' any of the surrounding plastic. This will require
a fine-pointed soldering bit.

Then U44 must be reinserted into the remaining holes of the socket
again, with pin 15 either broken off (as recommended, and as I did)
or bent up so that no contact will be made with the wire now connected
to socket hole 15 (or to anything else of course).

Note that bending the pin up also causes some risk of shortcircuit if
you later push down on the shielding plate above this position, so
straight up is not a suitable way of bending it, and that would most
likely break the pin anyway.

>Also, I'll probably start out with a 16meg EDO memory
>chip for the CT2B FastRam. This may seem like a strange
>question. But is there a wrong way to insert the
>FastRam memory chip?

It is a SIMM, not a chip, and like all SIMMs it is polarized, but it
is possible to damage the socket if insisting on forcing the SIMM into
it in the wrong orientation. (Just flip it 180 degrees instead.)

>And, If you just wanted to try out the Falcon in the
>standard configuration without Turbo mode. Does a
>EDO memory chip have to be installed in order for the
>Falcon to run in standard mode with a CT2B installed?

No, you can even boot TOS 7.x mode without the SIMM.
That is only useful to experiment with the kind of PMMU
map used for TOS 7.x, so this is not something ordinary
users should do. Without FastRAM it is better to stick
to TOS 4.x mode.

>If, all goes well I'll be starting the installation
>this week. So any help with these questions asap
>is much appreciated.

I can only hope this info reaches you in time then.
That is out of my control anyway.

>And if there is anything you can
>pass along that I should know before starting out,
>then please do so.

One thing, easily forgotten, towards the end of your
installation is not emphasized enough in the docs.

The small extra board which is inserted into two chip
sockets labeled U62 and U63 has far too long 'legs'.
When the machine is reassembled the shield plate will
press down on some of the connections of this board.

Centek recommend that the underside of the plate be taped
for fixing this, but tape is thin, and easily cut if you
slide the plate into position, or have to nudge it a bit
in adapting the position before fixing the position with
the screws. That may then cause short-circuits.

I use a piece of paper as well, double folded to a rectangle
that covers that entire extra board, and also fills up the
space to the front edge of the plate.

That piece of paper should be put into position on top of
the extra board as the plate is to be mounted. The sharp
tips of the 'legs' soldered to the top of the board will
catch the paper and hold it in place, and it will protect
the tape on the underside of the plate from being cut,
thus making short-circuits here impossible.

Normally the end result of this will be that you will have
both a paper layer and a tape layer between the board and
the plate, but even if the paper is pierced it should still
protect the tape.

Oh, then I understand what you mean. Actually this was another part
of the stuff on background/foreground use with another GDOS then.

My point, however, was to emphasize that some compatibility exists
in NVDI for older GDOS drivers. Something that may be useful to
know, especially if it applies to screen drivers as well.

>
>There must certainly _be_ a standard. The question is if it's _available_.

Well, as some drivers seem to work that are quite old (non-NVDI), some
programmers apart from the Behne brothers must have some of this info.
I suppose some of it may have been included in the atari docs for their
'official' developers, but as I haven't got those myself I'm not sure.

>For now, people who already own NVDI may want to use it as foreground VDI
>so that they can still get their vector fonts etc on the screen.
>I fully intend to eventually support all (as far as that is possible)
>the NVDI additions in fVDI.

Good, but realistically we must accept that it is a development process
that is likely to take some considerable time. For maximum usefulness
until it is complete, it is important that it works well in cooperation
with other GDOS, including NVDI.

>>It really would be unnecessary duplication to invest a lot of work to make
>>fVDI into a replacement for all the things handled by NVDI.
>
>Not in the long run, and not for some potential uses for fVDI.

>For example, I intend to make fVDI usable under MacMiNT and (obviously)
>the Fenix OS. Ports to one or more Atari emulators and the Tempest (in
>PPC mode) are also very likely.

For the long run I agree, but at present other things should be prioritized.

>>No, I realize that, and I suspect that it might be better to make a definite
>choice of how fVDI can and must cooperate with NVDI and/or other GDOS. That
>>might help in making some implementation details simpler and more consistent.

>It's certainly easier to have fVDI in the background, but on my AB040
>with an Eclipse/RageII that means about three times slower text output
>according to GEMBench, if NVDI is in the foreground. The other GDOSes
>would be a lot slower than that.

I see your point, and for maximum speed it is of course necessary to
eliminate any unnecessary entries in the AES/VDI dispatcher chains.

>>I suppose I shall have to experiment a bit with the current fVDI to fully

>
>Please, let me know if you run into any problems.
>The easiest way to experiment with fVDI is to run it from the desktop.
>You can then shut it down whenever you like.
>
>The very latest beta version (uploaded today) can now fill polygons.

I'll visit your page again and try to make time to test the new version.

Btw: In order to work well with my CT2B, it is imperative that it must
replace the inoperative blitter control function of Falcon TOS
with an operative one, so that hardware blitting can be fully
disabled, as the blitter is unreliable at 50 MHz. As yet I have
only found NVDI able to do so. Can fVDI do this too ?
If not, then I will have to use it in combination with NVDI.

>>I see. Actually you might want to consider other call methods than the

>
>True, but I don't think it's much of a problem, really.
>Doing things pixel by pixel will be slow no matter what, and most other
>functions need all of the registers anyway, and do a lot of work.

Yes. Whenever an overhead is incurred for a large amount of work,
then that overhead becomes insignificant. But for small and simple
functions, that may be invoked very frequently, any overhead at all
can cause significant overall delay.

As VDI contains both types of functions it may still be worthwhile
to consider alternative speed-optimized interface methods. If even

a single frequently used function benefits from this, then the method
has 'paid off', even if no other functions gain any noticeable speed.

The key to this decision lies in whether or not any frequently used
function can benefit by such a change or not.

Roy.
I run Stoop 1.05 unreg. so 'ran' to your site. Found only the Stoop 2.0 version. which I've already tried and didn't like - it flashed through loading, I could only get it stable by disabling DEFAULT.CFG and just doesn't look so good on my RGB monitor. No 1.05 key as such, but found a user ID and key in the DEFAULT.CFG which seems to work in 1.05. Is this what you meant?

Subject: Important Atari.Org Information

This is a short notice to inform you that Atari.Org will be temporarily offline between 5pm (GMT) June the 11th until approx. 5pm Monday June the 14th. This will effect mail forwarding, POP3 mail accounts, most sub-domains and hosted sites. The main web site should still function correctly. The reason for this is the server Atari.Org is hosted on is being relocated to new office premises. It will also be placed on a much faster line with better European connections. So bear with us please and don't email saying "it's down" !

Thanks,

Richard Davey
Atari.Org

> Indeed, and magnetic fields do not behave normally at such temperatures.
> Actually this could be used to design special media that can only work
> with such cooling, allowing much denser storage.

Cleaver. Heard any news from the norwegian project where a new type of
(crystal array I think) memory without moving parts is being developed? A
unit the size of a matchbox could hold some 20 terabytes of RAM. Reminds me
of the modules in HAL in the movie 2001. Apparently no mentionable heat
dissipation and no current consumption to speak of.
Access rates much below today's and the data stays until you actively change
it.

Will hopefully replace both RAM and magnetic media?

> At really cool temperatures, like 40 degrees kelvin , those effects are

Maybe we've flipped out too far, since the discussion was about how to cool
this CT2 of yours? Only fast and cheap way I can think of is bigger
heatsinks and more fans.

In a way he was right, there is no such thing CALLED "Falcon LAN to Modem
Cable"...

> Will the Mac to Modem cable work straight away or will I
> need to make a modification?

It works straight away. Choose software handshaking.

> I could use any info, text files, or diagrams about using
> any of the Falcons or STe ports as Modem ports and Networking ports.
> Such as MIDI, Parallel, Advanced Joystick.
> I'd need cable information. Pin outs and such.
> I remember that STalker could use some of these ports for
> modem connections. Just never could find the info on
> the cables.

Stalker allows you to -communicate- via the MIDI ports, but not necessarily
with a modem! For instance, a MIDI connection can be made between a TT and
an ST with which you can transfer files between these two. You can also use
the ST as a texterminal on the TT when running MiNT (or maybe Linux).

> Is there a way to make these work with the Falcon?

They work, you only need the right cabling.

> Yes, that would be the easiest way. Will the Falcon see this drive
> as drive B?

The drive must be jumpered as a DS1 device.

> I really wanted to add a floppy port so that I could try to use
> ST cartridges on the Falcon like the Happy Discovery Cart, Spectre
> GCR and etc. It would also be nice If I could use my old SuperCharger
> on the Falcon. But it requires a DMA port/cables.

The Spectre GCR doesn't work with a Falcon, I doubt the others do either.

> I've tried hooking it up to a VCR but the display isn't as good as it
> should be, or I'll get no display at all.

The connection between the F030 and a VCR differs from the (optimal) connect
ion for a TV. On a VCR you don't use RGB.

> I have a composite output modification on my STe (Done by someone
> else) and it gives a excellent clear display when connected to the
> VCR. I wonder if this same modification can be done on the Falcon?
> I sure could use it.

No need for that. You just need to make the right cable.

> Hmmm..again, I didn't know anyone made Windows only printers.

There are Windows modems and other stuff as well. These devices are stripped
down to bare essentials, then a program in Windows emulates or replaces all
the hardware that isn't present in the printer.

The device becomes cheaper this way, but on the downside you can't use it
with other operating systems, or even not with different revisions of
Windows.

My idea is to print test patterns to such a printer and "listen" to the data
that passes on the printer port. The data would be dumped to a file and
analyzed. A table would be created for the various possibilities. An inkjet
printer with 48 nozzles would then have 2^48 possible combinations in black
and white printing (dot or no dot) per each move in the horizontal
direction. In color there would be much more combinations but it's the same
principle.

A program would create these relevant test patterns and other necessary
graphic primitives.

Actually, it surprizes me that the manufacturers of such equipment only
cater for the needs of Windows users? Is Atari or Linux money less worth to
them?

>This should allow some air to move underneath.
>The bottom Fan would probably cool better.

Sure, but never enough. It didn't even help to remove the
PSU, and keep both the top cover and the shield plating off.
Without a cooling fan directed at the ispLSI chips it never
has worked right. No form of 'natural' cooling has sufficed.

>How about using some of those old slanted printer
>stands. Those would set the back of the Falcon up
>while leaving the keyboard down. Like a sports car. ;)
>
>I know heat rises, but If I put my hand under my desk
>where my Falcon sits, especially around the PS it's
>pretty warm.

True, and some of that heat would be removed by your idea,
but the effect on internal chip temperature would be very
small. Much too small to make any difference to my CT2B.

>The motherboard bottom shielding probably acts like
>a big heatsink anyway.

It does absorb some heat, sure, but it can never dissipate
it efficiently through the plastic, so there the similarity
to a good heatsink ends.

Hi Tony.

on Tue 15-06-1999 00:37 Tony Cianfaglione wrote:

> Is there a version of CAB that will run on a 1 meg 1040 STf along with
>STinG 1.20.
>
> I have STinG running on it but CAB 1.5 bombs (with 3 bombs) every time.

I assume that you are using the correct version for an ST, not the 68030 version but the one for 68000. The same also goes for CAB.OVL. If this assumption is correct, then CAB must be failing due to lack of RAM.

That is the only CAB version with any chance of doing the job though, so you need to start with a perfectly clean boot, not even STinG loaded, so you can prepare its setup as needed.

Then start CAB.PRG *without* having the CAB.OVL present in the same folder. That saves some RAM, and ensures that no attempt is made to contact STinG, which was not booted this time around. With some luck this should allow CAB to start up properly, though naturally only with offline capability.

Next you go through the display settings and turn off all image displays, and set the RAM cache to some really low value (Try 0, it works here). That cache won't really be needed anyway for most text pages, and you can't get reliable graphics display without more RAM. Save these new settings, and just to make sure, restart CAB to check that it is not allergic to the settings saved (which has happened on some occasions).

Next, kill any STX files that you don't need, as they will only steal RAM, and that may be more than just program size, if they need buffers. The STXs you will not need, that are in the STinG 1.20 packager are probably two. The ETHER.STX is for Peter Rottengatters Ethernet board (Riebl board I think.) and is not useful for you. MASQUE.STX is also not useful, except if you want to use a modem connected to this STF, and use it to masquerade some other machines. That is not a good idea anyway, if you plan to use this machine for browsing, as it is not really fast enough to do both things well. So you should erase both ETHER.STX and MASQUE.STX, to save a little more RAM for CAB.

Since you will not be using multitasked STinG clients or servers either, you can also try setting the ALLOCMEM value in DEFAULT.CFG to a lower value, such as 50000 or 60000.

Now you reboot with the necessary STING.PRG, and XCONTROL, and the other stuff you want, but still avoiding wasteful RAM usage. It is for example important not to be using late-version NVDI, or THING desktop in such a

boot, as they both waste RAM something awful (for so small a system).

If you have done all the above properly you should be able to browse most HTML documents online in text-only mode, but if you reach any really 'heavy' text pages (eg: the RFC index at FUNET.FI), then you can still suffer bombs, as there may not be enough RAM free to read such huge files.

You may also need to experiment with the available CAB.OVL files, to see if this makes any difference to the RAM used. It is very likely that the newer and smarter (and more speed-optimized) versions may waste more RAM than some older ones. So on a 'low-end' system like a 1040 STF, the old stuff may work better. Only tests can prove it.

>used for? How do I update the address in the card's memory?

I have no idea about the hardware setup needed (if any).

>Any hint about using one with MiNTnet?

Nope, except that I've seen a rumour that it should be possible.
So why am I replying to this at all then, you may ask.

Well, I just remembered that a Riebl card was exactly what Peter
Rottengatter used, and for which he wrote the ETHER.STX which is
part of the STinG 1.20 distribution package...

So for STinG, this card should be more or less 'plug-n-play' :-)
(Except for possible hardware strap needs.) And if there is any
problem, we do have access to the full source code as well, as
this was sent out to the beta list quite some time ago.

I now it may be useless to even mention this to the NMD developer,
but you could try it at least, as there is no conflict in using
MiNT and STinG 'side-by-side' as long as they use separate ports.

In fact it should even be possible to write a combo of STX and XDD
files that act as a local gateway from STinG to MintNet and vice versa,
though I know far too little about XDD construction to do that job.
(It is certainly possible at the STinG end though.)

>> the A version. Alot of differences with the chips it seems.
>
>I can answer Roberts doubt, the rev.B still has the same DSP IRQ "bug"
>as the rev.A version,

Yep, that is so.

>simply because Centek has principal objections against using this signal.

'Principal'... Well maybe so, but I think it is mainly because they do
not want to implement any DSP interrupts in their Fenix computer, as it
will allow boards with a variable number of DSPs connected. Serving the
DSP interrupts could get rather messy with that system, so they do not
want to do it at all. They don't want to do anything for the Falcon
in a way different from what they plan for the Fenix, as they regard
the Falcon mainly as a 'testbench' for Fenix development.

>I guess I can agree with them, but they should stop claiming that the
>Falcon with CT2 switched off is 100% compatible with an original Falcon,
>because it's not.

That is true in even more ways too, as they have abolished the supervisor
requirement for system variable and I/O accesses, and will allow writes
to ROM areas without generating any bus error. Pretty big differencies.

>An original Falcon allows the software to read the DSP IRQ signal, no
>matter how dirty this is.

It is the interrupt acknowledge from the DSP that does not reach the
DSACK0 signal of the CPU. It is not a question of clean or dirty
signals, but of combining them properly onto the CT2 bus, which the
CT2 design simply neglects doing.

The INTERDSP patch by Didier Mequignon does fix this properly, and has
been tested by both him and me. I even tested several variations of
essentially the same logic, as I was unsure of the results with one
test program. But it is fully verified now. It does work correctly.

And it is interesting to note that some of the programs that then do
work perfectly did not work at all without the hardware patch, even
when DSP_IRQ.PRG was booted from \AUTO\.

Quite possible you saw my wife. Whilst I was at the semiar room (almost
from 16.00 till 20.00) she and my boy were trying to play games with the
Jaguar console which wasn't so easy but nevertheless they have had a great
time.

Hi everybody,
I tried several times to print in colour and also in monochrome the website/homepage of www.tagesschau.de .
I use CAB 2.7/MagiC 5.2/NVDI 5.1/Jinnee 1.1 and a HP 400 (Colourcartr.)HP 500 (B/W cartridge)
I tried several ways :'Print images' on/off,'Background Images' on/off, Monochrom on/off,
Background white on/off .I changed the settings to Vollfarben and what I got was a full blue page without any text.In monochrom I did get nothing at all !!
My brother with his Pentium had printed this page almost immediately.
Why can I achieve this ?
Please help me, I don't understand, I don't see no frames etc.
So try it yourself and when you succeed, let me know !
In black and white is also OK of course...
Jos

671. HELP: Horiz shift on RGB/comp video screen...

Newsgroup: comp.sys.atari.st

From: J WILKINSON <jwandjw@ihug.co.nz>
Message-ID: <3765AD0B.3263A24B@ihug.co.nz>
Source record: 77291

Hi there,

I'm currently trying to put together some nice 24-bit JPEG piccies and some 16-bit .FLH animations (using APEX media) to create some video titles for a video I'm making of a small holiday I've just been on with my partner in New Zealand.

The JPEG and FLH files are 768*576 resolution (PAL broadcast res) which can be displayed by the APEX viewers no trouble, except that the images are centred too far to the left. I'm displaying them on a Sony 25" TV and I get a 20-30 pixel black line down the right hand edge of the screen, plus 20-30 pixels missing off the left hand edge. How can I put the pictures into the middle of the screen? I also see the desktop is off-centre when I use a TV/RGB monitor. Is there a patch to change the hoziontal positioning? Or is there a hardware fix? I know that Videl Inside can be played with to get a centred desktop on TV/RGB but the APEX viewers don't use VI's screen modes.

Please advise...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

PS. Anyone who helps here is welcome to receive some nice JPEG pics of my holiday if they would like!!

ok, I have DSP_IRQ.PRG. I'll try it first. Might do the hardware patch
l8ter on. I have the docs here that describe how to do it.

You don't have the B version? I looked at some pictures of
the A version. Alot of differences with the chips it seems.

Yes, I know NVDI is good. Just wanted to know if I can
simply use some type of software to turn off the Blitter
if that needs to be done, and run in turbo mode without
NVDI if I want too?

And, Is there any other software similar to NVDI like
Warp9, FVDI, or etc that I can use instead of NVDI if I want or
need to?

I went back thru the docs and etc. I now know for sure what
to do with Chip U44.
Just wanted to make sure that I get it right the first
time I do it. ;)

>Have a look to the simm! Simm board only can insert in one direction.
>With wrong direction the simm doasn't snap in.

>Use a EDO with 8 chips and a "9" on boards no. "5" doasn't work well.

ok, Just got my EDO FastRam Simm board. 8 chips, There is a 9
on the board number. :) Also the chips appear to have been made in
France. Has France on them, And was assembled in the USA. Cool!

Now that I have everything, I'm ready to go. ;)

Will start the installation tonight. Wish me luck!

And thanks for the help,

<snipped and saved> ;)
Thanks very much for this info.

Ya know I asked someone about a Falcon LAN to Modem
cable not long ago and this person said that nothing like
that existed!
This person, who I will not name, deals in Atari software/hardware
and has a rather large supply of Atari stuff.

Will the Mac to Modem cable work straight away or will I
need to make a modification?

I have some RS232 and other Null Modem cable adapters that I might
could use for connecting all my Ataris together.

I could use any info, text files, or diagrams about using
any of the Falcons or STe ports as Modem ports and Networking ports.
Such as MIDI, Parallel, Advanced Joystick.
I'd need cable information. Pin outs and such.
I remember that STalker could use some of these ports for
modem connections. Just never could find the info on
the cables.

Also, I have been looking for a diagram or text file on
how to connect a 5 1/4 PC type floppy to a ST/STe.
I have a cable here with the correct adapters and at one
time all the wires appeared to have been connected up.
But it was done by someone else and the wires have
came loose on the floppy connector before I got a chance
to try it out.
Do you have a text file you could pass along or a
address where I can find how to hook up the wires?

>
>It appears to be a 2.5" to 3.5" adaptor for IDE drives.

Yes, Thats probably what it is. I'll hang onto it
just in case I need it in the future.
>
>
>> Not sure what you mean here. Are there 2.5 SCSI drives?

>
>Yes, lots. You can ask people with portable Macs.

First time I have ever heard of them. Have never seen
any advertised for sale. Mostly see PC stuff.
Is there a way to make these work with the Falcon?

>
>> Would you happen to know if there is anyway to connect a second
>> 3 1/2 disk drive to the Falcon. I'd like to add a standard ST/STe
>> type floppy port to the Falcon.
>
>It is possible, but I haven't tried to do this. Never needed two drives.
>Easiest should be to press another connector to the flat ribbon cable that
>goes to the floppy.

Yes, that would be the easiest way. Will the Falcon see this drive
as drive B?
I really wanted to add a floppy port so that I could try to use
ST cartridges on the Falcon like the Happy Discovery Cart, Spectre
GCR and etc. It would also be nice If I could use my old SuperCharger
on the Falcon. But it requires a DMA port/cables.

>> Do you know if the Falcons monitor port can be used with a monitor
>> by its self without any of the Falcon monitor adapters connected?
>
>It can not.

Do you know of any modifications that will allow the Falcons TV port
output to give a better display?
I've tried hooking it up to a VCR but the display isn't as good as it
should be, or I'll get no display at all.

I have a composite output modification on my STe (Done by someone
else) and it gives a excellent clear display when connected to the
VCR. I wonder if this same modification can be done on the Falcon?
I sure could use it.

>
>Well, that's the charm of using an Atari, you can do great deeds yourself!
>I've thought of making a windows printer work on an Atari, just for the
>sport of it...

Thats what I've always liked about Atari stuff.
But creating Drivers for PC video hardware is not something
I could easily do. I'm more into the hardware hacks than software.
But wouldn't mind learning if I had the time.

Hmmm..again, I didn't know anyone made Windows only printers.
Don't use anytype of Windows much, except version 3.1 on the Falcon
with FalconSpeed from time to time. Mostly I use Dos with FalconSpeed
cause the Modem works with it. It won't with Windows 3.1 for some
reason. You wouldn't happen to know a fix for this would you? :)

Not that I like Windows, but it would be interesting to get the modem
working with it. Dos communication software works fine with
FalconSpeed. I think the Windows 3.1 modem problem has something
to do with the Atari Mouse being remapped to work on a Windows Com port.
I've tried setting different Com ports and etc. With no luck. I get no dial tone.
Ya know anything I can try?

>
>MG
>
Thanks very much for your help its much appreciated,

>will depend on how the damaged capacitors distort the waveform.

Yes, I think.

About my new problem...
Since 3 days, I have another pb, I have "Coprocessor Protocol Violation" exception
with all programs at start. The first day, after 10 mn it's good again. Yesterday
same problem... good after 30 mn. Today this error not disappears.
BubbleGEM, PD, CAB, Centbench crash at start. In normal mode... same problem.
I have looked inside, I have removed FPU, put again FPU on CT2... same problem.
Power supply is good, maybe a bad solder on CT2B or an FPU destroyed :-(
It's a 68882 33 MHz bought with my CT2B.

Regards,

Didier.

THe cable that comes with the modem should work, it'll have the modem
connector at one end and a siamesed 265 pin and 9-pin connectors at the
other....sounds klike you've got a printer erxtension or possibly a serial
extension cable there...

Hi,
Certainly one reason is for internet access, I use it with my
PC. Hughes DirecPc has speeds of up to 400,000 bps. And since
I mostly download Atari St files, small by comparison to Win
files, it's incredibly fast. All Atari files D/L in a few seconds
at that speed. I move them to my TT030 with Ghostlink
after D/L. I would like to try to setup TCP/IP with a VME
network card on my TT and see if it is possible to share this
connection as I do with my wife's laptop on a home network.
But I haven't been able to find a network card for the TT.

This is certainly a major issue for keeping TOS computers viable for the
next generation of wide pipe net connections.

>I don't really see any particular reason why a telnet client should
>require font handling routines from GDOS, but I would suggest either

TVT102 uses GDOS fonts to provide the extra characters needed for the
graphics characters used in some terminal modes. The relevant fonts come
with it.

IIRC Telstar also uses GDOS fonts, though this might be optional.

The graphics characters aren't so important if all you need is a plain text
terminal, but some telnet applications need fuller emulation than that. Most
assume VT100 or better, whereas the basic Atari terminal is VT52 and not up
to some jobs on its own.

For instance, I work in a university library and our library catalogue is
available via telnet. It uses lots of (text based) drop-down menus and
boxes. TVT102 is the only STiK/STinG telnet client which can handle it. The
only other thing I found which worked properly was the MiNTnet telnet client
running under X. It's possible that this would now be OK under GEM with a
later version of Toswin, but I haven't used MiNTnet since it stopped working
with my ISP a few years ago (original TAF package) and I couldn't work out
how to upgrade it.

684. MagiC Online Programming Contest

Newsgroup: comp.sys.atari.st
Date: 1999-06-16 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <dLF93.6910$8%6.556002@news1.telusplanet.net>
Source record: 77160

Hello again!
Today I registered with a banner service. The banner pays 10cents per click. So here is what is going on:

The banner has been placed at the very bottom of the main page. I know I said I would not have it on the main page, but the rules dictate it this way. I do not want to commit fraud in anyway and would like to raise the prize money honestly.

The prize will be:

500$

Calculations show that with the amount of traffic MagiC Online recieves, if HALF the number of visitors click on the banner, this will generate 280$ (american) A month. Thus, each contest will last between 2 and 3 months, longer if the 500$ prize has not yet been reached.

Please note: Although the banner is currently on the page, it is no activated! I am awaiting validation! So please save your clicks!

This is very exciting for both programmers and Atari users! Atari users will see a great deal more programs being produced and will actually have a say in what they want made! And programmers, well, dont you want to make 500$ american?

This is where I need everyone's help: We need to establish rules, we need to make guidelines, we need to make this happen!

What should the first contest be? Some possible options:

Best new GEM Game
Best New Internet App
Best new utility..

There is one rule which is a must. The program submitted must not have been already in existance. For example, QED could not be submitted, nor could CAB, or Airc etc. This will force NEW programs to be produced.

Furthermore, the author of the program must submit his own program.

Ofcourse these are all rough and more rules will follow. But please everyone, help me out.. send your thoughts, idea's etc. Should the 500$ prize be raised or lowered?

Finally, it will not be just programs which can win prizes. Although the first contest will be a programming contest, in the future we will have Best MagiC background, best Icon set, best webpage, whatever! Its all up to

you, you make the categories.

Please remember not to click on the banner yet, and to send me your feedback.

PS spread the word about this please, the more people aware, the more successful this project will be.

Thanks again,
Bengy

Is the software patch better to use than hardware patch?

BTW, I got my CT2B installed. Finished it up today. :)

The installation took abit longer than expected.
Ran into a few modifications that I wasn't sure about.
But after getting everything hooked up it booted up the first time.

I did make one mistake. That was wiring up the Turbo switch wrong.
3 pins and 2 wires. I had a 50/50 chance of getting it right the first
time. Thanks to Evl on IRC Atari for pointing this out before I
started taking things apart. ;)

Not had time to get it all setup correctly but noticed a few things.

It seems when I install Flash updates that this causes my NVRAM
language to change to French.
I cannot set any NVRAM settings within the CBOOT.PRG. However I can
use other NVRAM software to set and save the NVRAM settings back
to English. All the other options in CBOOT.PRG work fine.
Is this a Bug in CBOOT.PRG?

When booting in Turbo Modes. HD Driver hangs when scanning my SCSI
drives. If I turn off my SCSI drives. Turbo Modes seem to work fine.
Is there some setting I'm over looking for SCSI drives in TURBO mode?
SCSI drives work fine in Normal Tos Mode.

Any known problems with HD Driver and CT2B in Turbo Modes?

Well, I'm just getting started with it. So far, I'm real impressed.

Thanks to everyone who helped answer questions and etc.

686. I need help getting my Atari on the Internet

Newsgroup: comp.sys.atari.st
Date: 1999-06-16 00:00:00 UTC
From: Darren Nelsen <dmn@mindspring.com>
Message-ID: <7k7gqg$2jc$1@nntp8.atl.mindspring.net>
Source record: 77162

I have an Atari Mega ST2. I'd like to get it on the Internet. Any help would be greatly appreciated.

First, I need a power cable for my modem (sx212). Where can I get one? RadioShack couldn't help me.

Second, what kind of software do I need for TCP/IP and the web? Any recommendations will help.

Third, I'd like some information on file compression formats and programs commonly used to compress/decompress them.

Thanks!
Darren

I'd recommend a low profile SIMM, otherwise the keyboard needs some spacers
to stop it pressing on the edge of the SIMM (and bending the CT2).

Yes, but after a few modifications to the drive (in any case), and to
the ST (if you want to use the HD mode).

This is in the Quick FAQ

Well, one is CAB.APP, the other is CAB030.APP, which is pretty obvious,
so that might not be your problem.

Is that the old Atari 1200 baud modem ????

I think you can forget connecting to the internet with that, especially
to the web.

An old 28.8K modem is cheap and perfectly adequate for an unmodified
Mega ST.

> Second, what kind of software do I need for TCP/IP and the web? Any
> recommendations will help.

STinG for the TCP/IP stack, CAB as a web browser. This is all in the
Quick FAQ, along with instructions on setting them up.

> Third, I'd like some information on file compression formats and programs
> commonly used to compress/decompress them.

Well, it's pretty easy to figure out actually:
.ZIP ST Zip
.LZH Lharc
.ZOO Zoo
.ARC Dearc

A shell like Two in One makes all of these much easier to use. I would
highly recommend it.

You'll find all of these programs in the UTSI: http://utsi.atari.org

> upgrade?

The STF motherboard only has room for 1Mb onboard, and this is with
soldering each chip, pin by pin. If it's a 1040, then it'll already be
maxxed out. Not worth the hassle IMO. If you want to add RAM to an STF,
better get a 3rd party ram expansion board. These go up to 4Mb, and
sometimes use SIMMs.

> about using one with MiNTnet?

Thanks to Leo for the NetBSD Faq, it cleared up a few things, not
just about the Riebl, but also about SCSI termination and a few
more things.

Ronald, we already have GlueSTiK that patches STiK calls into MiNTnet,
but indeed a low-level interface might be even better. The problem
is, STinG is currently known not to work on AES 4.1 and MiNT.

Jo-Even, yep, got the MiNTnet drivers, but the instructions are
rather vague. I'll see what Torsten has to reply.... ;-)

Message-ID: <37676E30.DE669309@patent.gov.uk>
Source record: 77169

I've looked at the structure of the page in Netscape, and it's a pig !!!

a. It's framed with a java auto scrolling part to the top horizontal frame. (http://www.tagesschau.de/v929523895254/java/frame/head.html)

b. The whole structure is below. I think that Cab has as much chance of printing it in colour as a wax cat living in hell!!

c. If it's any consolation, Netscape and my LaserJet 4p won't print the background (marked blue in colour)

Sorry to raise your hopes.

Bob King

GDOS is the bit that Atari left out of their OS to fit it on the chips.
It deals with various aspects of graphics display and printing. If you
use NVDI4 or later you will have a vector text aware version of GDOS.
If you want basic GDOS give a yell, there are various other(better)
version such as GDOS+, but NVDI4 is by far the best. IMHO you will need
this anyway to print from CAB.

Rather "What is Marcel"

It's a freeware text editor/word processor, that handles just about
every word processor format on the Atari, including RTF and TXT, which
makes it very handy for file conversion. You can get it from:

http://www.cyberstrider.org/computing/atari/support.html

The original archive is the 68000 version I think. 68030 (or 68020 ?)
version should be noticed in its own archive, and iirc there is just
the program. The 68000 version I have is 290040 bytes.

Bye,
/Pascal/

STiK ? You could consider upgrading to STinG, which is more modern, but
well, since your setup seems to be working...

> This is truly fun! Alright, I've got mail, newgroup, browsing, and
> IRc in the bag. When I try to use the Telnet utility that goes with \
> Stik, it mentions that I need to be running GDOS. My question now is,
> what is it and where can I find it?

When Atari implemented GEM on the ST, they included just about
everything in ROM, but decided there was no need to include GEM's
printing and font handling routines, called GDOS.

At first, some programs were distributed with a version of GDOS that was
licenced from Atari, then there were some replacements, such as G+plus,
FSMGdos, Speedo GDOS which were all commercial. The latest free version
of GDOS that I know of is fontgdos.

Later, NVDI included it's own Speedo GDOS routines, so if you have NVDI
you shouldn't need GDOS.

I don't really see any particular reason why a telnet client should
require font handling routines from GDOS, but I would suggest either
getting some flavour of GDOS, or switching your telnet client. GDOS
requires quite a lot of RAM (for fonts), and is rather slow, at least in
it's older versions.

I have a zipfile containing fontgdos and few fonts to go with it. Mail
me if you want me to send you a copy.

701. Falcon modem question

Newsgroup: comp.sys.atari.st
Date: 1999-06-16 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <7k7v2n$b96$1@nnrp02.primenet.com>
Source record: 77177

I need to know what kind of cable I need to hook a modem to an Atari Falcon. I tried one from Radio Shack that looked like if had the right connections, and the plugs fit on both ends, but I couldn't get it to work. It may have been the modem, but I am not 100% sure. If anyone out there has a 28k baud external modem for sale and a cable to hook it up, or knows a cheap place to get both items let me know. I have been wanting to hook my Falcon up to the internet forever so that I don't have to use Microsoft products and crash all the time. -Satcom2

>RadioShack couldn't help me.
>
I believe that the SX212 used the same power supply as the Atari 2600. I used to power 2600's all the time with standard old 9 volt power supplies (from various other electrical gadgets), or multi-purpose power supplies with 4 prongs and little switches for different voltages, which are available at Radio Shack. I assume you could power an SX212 with many different power supplies commonly available, if anyone knows otherwise then feel free to correct me. -Satcom2

The Falcons serial port is pretty standard. A normal PC cable such as
the one that came with the modem, or a PC modem cable, should work.

Did you set the software to use the correct port ? The Falcon's modem
port is referred to as Modem2, not Modem1.

There are other useful reasons to do it too, but that is also a matter
of taste (in clients etc). Whatever the reasons, compatibility never
hurts anything.

>However, with the recent development of IP-masq. in MiNT-Net I no longer
>have any need for this.

Yes, I know. Mario and I had some nice Email chats about how best to fix
this limitation of MintNet. He could have done it anyway of course, but I
like to think that my help shortened his labor a bit.

Hi Tony,

----- snip ----- re: using a 68000-compatible CAB 1.5 version

on Tue 15-06-1999 18:28 Tony Cianfaglione wrote:
>
>How do you tell the diference between them?

The 68030 version originally came in a separate archive, containing only the program file and a small readme. The real CAB 1.5 package was still needed, and it was that package that held the 68000 version. I'm not sure if these versions have been 'repacked' by anyone though, so a size check may help.

The 68030 version is 288970 bytes.
The 68000 version is 290040 bytes.

All other files in the CAB 1.5 package are shared, so it is only the program file that needs to be changed if you have the wrong one.

BUT..., there are also '030 versions of some of the CAB.OVL releases. These may also bomb when loaded by CAB on a 68000 machine. That is one reason why I recommended testing without any CAB.OVL present with CAB. (Either in the same folder, or in the 'MODULES' subfolder.)

Do this to make sure that CAB itself will run properly, then install various CAB.OVL versions until you find one that works.

If you want to avoid such problems for the users that visit your support pages, the best way is to simply include only 68000-compatible versions. These will run on all 680x0 machines, and there is very little difference in their effective speed.

These reasons are also why STinG itself is only released in a single version for all users, regardless of which CPU they use.

Hi James,

on Tue 15-06-1999 22:43 Lethor7 wrote:

> yep want to add a spare meg to my STf.

I don't think that is possible, simply by adding any
stuff. The reason is explained below.

>I think I will have to add it in increments of what???
>How does the ST handle its chips, in pairs, or in one lump
>upgrade?

All STs have 2 banks of memory, both 16 bits wide.
Each bank has three possible memory mapper states.

0 == 128 KB Two 128KB banks were used in the 260 ST :-)
1 == 512 KB One 512KB banks => 520 ST, Two => 1040 ST
2 == 2048 KB etc...
3 == reserved (never implemented)

The max legal mapping of 2048 KB in each bank is equivalent
to an STe with 4 1MB SIMMs inserted in its sockets.

The mapping value 0 is used with double meaning, as that
is also the value used for an empty bank. After all, no
one has any use for a 128KB RAM bank today. In any case
we never need to bother with these codes, as they are set
up by the TOS after the RAM test it makes on a cold boot.

This means that a 1040 STF already has RAM in both banks,
one half meg in each of them, so the only way to increase
RAM is to disable or remove the chips already installed in
at least one of the banks.

I have made such upgrades, wiring SIMMs to the appropriate
connections, but that is a tricky job, not for the less
experienced. Also, some ST MMUs are not capable of driving
SIMMs, especially not if the old chips are not removed, but
only disabled. Then they still load the DRAM address bus.

> Secondly, where do I buy such a chip these days, and
>where can I download the schematics to show me where
>this little rascal is hiding onboard the ST?

I think Best Electronics is the best bet, as they can
probably dig up the original service manuals. AFAIK
there is no place where the schematics are available

for download (which is a pity).

Even so, don't figure on getting precise instructions on
the RAM chips and their placement from any schematics,
as there were a huge number of board revisions, many of
which were motivated by a switch to new chip types.

>On 15 Jun 1999 10:47:57 , Maurits van de Kamp wrote:

----- snip ----- re: CT2B lacks functional DSP interrupts
>
>Is the software patch better to use than hardware patch?

No. Some things do not work with the software patch even
though they do work with the hardware patch. Also, the
software patch will treat any 'spurious' interrupt as if
it was a legal DSP interrupt, which is not good.

>BTW, I got my CT2B installed. Finished it up today. :)
>
>The installation took abit longer than expected.
>Ran into a few modifications that I wasn't sure about.
>But after getting everything hooked up it booted up the first time.

Good. Was that in compatibility mode then ?

>It seems when I install Flash updates that this causes my NVRAM
>language to change to French.

Mine is english, like it should be.

>I cannot set any NVRAM settings within the CBOOT.PRG. However I can
>use other NVRAM software to set and save the NVRAM settings back
>to English. All the other options in CBOOT.PRG work fine.
>Is this a Bug in CBOOT.PRG?

I don't know for sure, but it does work correctly for me.

>When booting in Turbo Modes. HD Driver hangs when scanning my SCSI
>drives. If I turn off my SCSI drives. Turbo Modes seem to work fine.

I believe that the word "seems" is indeed appropriate here. :-(

Try more cooling, concentrating on the ispLSI chips. I am sure this
will make some difference.

>Is there some setting I'm over looking for SCSI drives in TURBO mode?

No. Unless you use Cecile there are no special settings for SCSI.

>SCSI drives work fine in Normal Tos Mode.

That is to be expected.

>Any known problems with HD Driver and CT2B in Turbo Modes?

No. For me it works fine now, but earlier I could not use TOS 7.x
reliably at all, so naturally this also caused HDDriver to bomb at
times, but not due to any problem of HDDriver.

>Well, I'm just getting started with it. So far, I'm real impressed.

The speed is impressive, but the machines must run securely, and for
all I have spoken to about it, who have actually done it, that has
taken some effort to achieve. (New fans etc.)

>voltage of 12V output increases (no feedback for 12V !).

Ah yes, now I see. As long as the final capacitor (C13) is intact, the
feedback will still manage to keep the +5V output stable, but it will
be done with entirely different switching waveforms than normally,
due to the different load capacitance. And as the +12V has no feedback
the abnormal waveforms are simply rectified by D4, and then somewhat
stabilized by C14, L3, C17 and R14, as shown below. The result of
that will be a fairly stable voltage, but of unknown value, as that
will depend on how the damaged capacitors distort the waveform.

And that, finally, gives the first explanation of why one of my two
PSUs got a raised value and the other a lowered value on the +12V
output. This has to be because the capacitor damage differs such
as to distort the switching waveform differently.

D4 L3
Switch spikes X----|>|---+---))))))---+-----+---------X +12V
| | |
Transformer C14 === C17 === [ ] R14 PSU outputs
330u | 47u | | 390ohm
Switch ground X----------+-----------+-----+---------X Ground

NB: the 'Switch spikes' signal here is not the same as shown further above

>You PSU is removed, maybe you can made test...

Yes I can, but I have so many things to do, so it will have to wait a bit.

>>On my PSU the +5V output was correct all along, and it is only the +12V
>
>My +5V was always good...

Yes, I think I do see how it works now, as described above.

>I'am sure at 75% that is the same problem, at factory we have some problems
>with capacitors (heat or 'high' frequency is bad for this type), and not only
>on PSU.

Yes. Electrolytic capacitors have always been a source of problems.

----- snip ----- re: letting Centek fix your DSP timing problems (or not :-)
>>
>>Yes, that would serve no real purpose, unless you find some software that
>>requires the slower clocks to run in compatibility mode. But I think most
>
>Yes, but normally handshake is always used in 56001 code.

True, one can never rely on any special relationship between timing of CPU
and of DSP, so handshakes are a must anyway, and that means that it is very
unlikely that you will ever need that lower DSP speed in compatibility mode.

If that is the only change they offer, then I would forget about it.
It were different if they had a fix for the generation of compatible
bus error signals etc. That would be worth sending the CT2 away for.

Greetings all,

Today I have released a new version of my GEM heartrainer, hEARCoach,
that is quite an improvement compared to the old one.

Some news are:

- Answer through MIDI-in
- Chord support for internal sound
- Better control over interval trainer
- Ap-term, global window cycling
- Bugfixing

And more..

The URL is:

http://gokmase.atari.org

Have a nice & sunny summer! :)
Regards,

/Joakim

713. HSMODEM - Reassign 300 baud as 38400 baud

Newsgroup: comp.sys.atari.st
Date: 1999-06-16 00:00:00 UTC
From: au576@lafn.org
Message-ID: <1999Jun16.160410.26631@lafn.org>
Source record: 77189

Somebody told me that you can configure HSMODEM so that if you select 300 baud that you can actually use 38400 baud. Does someone know how to do this? The reason I'm asking is that I would like to use the Remote (mini-BBS) mode of STalker to link my TT to my Mega STe to transfer files. STalker only allows connections between 300 - 19200 baud. I would like to have a faster link, and 38400 would be a big improvement.

I tried the next higher connection (57600?) linking Serial 2 on both TT and Mega STe, but it did not seem to work (I could not see the characters I was typing appear at the other computer while running STalker at both machines with the same baud rate and communication port).

Can somebody suggest a good way to link the two computers together? Right now I have two modem cables and a null-modem adapter and can link at 38400, but with the STalker remote only at 19200. Thanks.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

>
```

How about hooking the TT to a PC (as a host) with a null modem cable and using PC_Gateway?

721. LAN Modem connection

Newsgroup: comp.sys.atari.st

Source record: 77103

Hello!

I am trying the idea of connecting my modem to the LAN port
via a Mac to Modem cable, as I've seen talked about here recently. One
problem, though: I can't get the STiNG dialer to recognize any port
except Modem 2. In the Config selection, under Miscellaneous, the only
option that comes up is Modem 2. I tried manually typing in LAN and
Serial 2 into the dial.scr file, and no change. How do you do this?

Hi friend:

I am quite sure that without a modification a Falcon can not do more than 19200 (14.4) try setting your port to 19200.

Hello, Jo!

I've sent you a couple of E-mails over the past couple months, and they've both been sent back with some sort of error, something about a bad host name or something. This has happened both replying from a newsgroup post and clicking on your "E-Mail" icon on your web page. Since your e-mail address apparently isn't liked by my ISP, is there another way to get an E-mail to you without having to post it here? Thanks!

724. CT2 is Cool!

Newsgroup: comp.sys.atari.st
Date: 1999-06-17 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7k9qrf$b1s7@news.ajou.ac.kr>
Source record: 77106

Had a little more time to mess around with the
CT2B Falcon.

Finally got some things straighten out.

The Speed is awesome.
I can now do 640 x 480 TC with no problems.
At the moment I'm in 640x480 TC with a virtual screen of
800 x 600. Also I have a port speed setting of 57600!
No Problems! Haven't tried anything higher yet. :)

With the settings above It is still very much Faster than
stock Falcon in 16 colors 640 x 480. Feels 3-4 times Faster.
This is in Tos 4.04 Turbo. NVDI Not Installed!
6.4 Gig 2.5 IDE is much faster too.

I will need to add another Fan.

Still haven't solved the Hanging on the SCSI drives in Turbo
Modes yet. But I left all my wires from the cables very very
long. I expect better results when I shorten em up.

When the SCSI hangs in turbo mode.
HD Driver only displays SCSI 0 and that drives identification
name is mixed up with my other SCSI devices names.

Like this.. SCSI 0.0 SEa onner/ meg

I have 4 SCSI drives on the SCSI port. 2 hard drives and
a CDrom and CDR. They are in a Mid Tower Case.

When in normal Falcon mode. SCSI works fine. and when booting
all SCSI numbers and device names are displayed as they should be.

Could the problem be that my main SCSI cable is too long for
TurBo Mode? I have to take the cable off of the Falcon before I
can use Turbo Modes. Leaving the Cable on with the power off
on the Mid Tower, causes the system to hang right after the
IDE drives info is displayed with HD Driver.
Take the SCSI cable off and no problems at all.

Most of the time the SCSI drive 0's LED comes on and stays on
when this happens. Its a Seagate 1gig SCSI drive.

Any help is appreciated,
phantomm@kih.net

Peter Slegg wrote:

> Exactly what formats are supported on the ST platform at the moment?

What exactly do you mean with "format"? HDDRIVER supports TOS compatible GEM and BGM partitions. With additional software like FreeMiNT or MagiC DOS compatible partitions and FAT32 partitions are also supported. And Minix and Linux ext2 partitions are supported with FreeMiNT. Note, however, that those partitions are handled by the filesystem drivers that come with FreeMiNT. HDDRIVER directly supports GEM and BGM, other filesystems require the appropriate file system drivers.

> Also I don't understand why I need a separate driver (Spin) for my CD
> when I have HD-Driver. Is there a technical reason for this or was it
> just a decision not to support CD drives. DVD drives are supported so
> I assume that they have more in common with MO drives than with
> CD drives.

DVD-RAM drives (to be more precise: DVD-RAM media) are directly supported by HDDRIVER since DVD-RAM media are basically the same like other removable, writable media. DVD-ROM media and CD-ROM media have special filesystem structures not compatible to those fileystems you find on hard disk drives. This is why special drivers are required here. It's like on any other platform: You need a low level driver for accessing the device (e. g. reading sectors) and a higher level driver that supports the fileystem, i. e. a driver that knows what to do with the contents of these sectors. HDDRIVER supports low level access to any IDE/ATAPI or SCSI device. But for filesystems on CD-ROMs or filesystems like FAT32, Linux ext2 etc. you always need a higher level driver.

> Any chance of adding Firewire support??

You have such a device connected to your Atari?

Arguably the most popular software over here is Semper (an update released a
few months ago) as the mailer, Jetmail (very recently updated) as the tosser
and LED (an update promised soon) as the OLR.

As you can see there is still some support, albeit possibly not for much
longer.

What is the problem is that no-one has responded to my question (in NeST)
asking if there was any chance of getting the States back into the
distribution.

Try a PSU with a 5V output which you can buy from an electronics store - the best one to look for is one with a regulated output and (I guess) about 1A output. They usually have a variety of output plugs, one of which should match your connector. That leaves the question of polarity, there is usually some means of swopping that I cannot tell you the answer to which to use. Perhaps there is a small diagram on the case near the power connector.

Did you edit the pacifist.ini file to make it point to the correct .img
files and .st files ?

Did you give it only DOS paths (8+3 filenames), not VFAT ones ?

Yes it can. Only the ST(E/F/Mega) have that limitation. The Falcon's
modem2 port can go up to 115Kbps.

I'm replying to this here since it might be of interest to others as
well.

The "problem" is that my ISP blocks mail from known spam-sites, your
ISP is probably one of them. If mail to "joska@nuts.edu",
"joska@nvg.org" or "joska@nvg.ntnu.no" bounces, please try my job-
address (Jo-Even.Skarstein@gjensidige.no) or directly to my Palm Pilot
(joska@online.no). Please use these only as a last resort.

Right, but what more?
I know what centek send to some people..
Isnï¿½t funny.

Some people here, maybee only an handful, are realy intressed in
a ct2 tt-board. I think they canï¿½t make them for nearly the same
price as ct2 falcon. More cash is to expensiv, nobody take them..

Also i still use v 1.99 of ct2 (A) flash, canï¿½t install 2.01
Latest putflash dosanï¿½t accept latest .bin file. (equal witch language)

Not one clear answer for a simple question. I quit that.

A question for the manual...
Not all points clear.

> I did make one mistake. That was wiring up the Turbo switch wrong.
> 3 pins and 2 wires. I had a 50/50 chance of getting it right the first
> time. Thanks to Evl on IRC Atari for pointing this out before I
> started taking things apart. ;)

Istï¿½s hard:

Switch: (side view)

###-o 1
###-o 2
###-o 3

1+2 if the knob looks downwards
2+3 if " " " upwards

> Not had time to get it all setup correctly but noticed a few things.
>
> It seems when I install Flash updates that this causes my NVRAM
> language to change to French.

Thatï¿½s "normal" :->
Open NVRAM again, set it back to your language. Boot again.

> I cannot set any NVRAM settings within the CBOOT.PRG. However I can
> use other NVRAM software to set and save the NVRAM settings back
> to English. All the other options in CBOOT.PRG work fine.
> Is this a Bug in CBOOT.PRG?
>
No, sometimes it isï¿½t work. Same as here. I donï¿½t know why.
But with a master reset of the NVRAM, it will work agin.

BOOTKONF.PRG also mismatch the NVRAM..
Looks like it works only for "normal" falcons.

> When booting in Turbo Modes. HD Driver hangs when scanning my SCSI
> drives. If I turn off my SCSI drives. Turbo Modes seem to work fine.
> Is there some setting I'm over looking for SCSI drives in TURBO mode?
> SCSI drives work fine in Normal Tos Mode.

Cecile / HDDriver doasnï¿½t found some older SCSI devices well
(Turbo mode only) (Same bullshit as with older IDE devices)

Drives the definitly do not work here:

Conner 64MB 2.5" IDE
IBM 31080 3.5" SCSI (1Gig)

Both fine for normal mode, but NOT for turbo!

> Any known problems with HD Driver and CT2B in Turbo Modes?

Think thatï¿½s only a thing of your devices.
I changed my internal conner to a toshiba 2.1Gig (MAT-Series)
and the external IBM 31008 to a Quantum Fireball -> perfektly

With your description i think thatï¿½s the same problem.
(Same as here, november last year)
(From this time forwards, not one spezific clear answer
from centek about this or any other trouble)

Most given answer: Send your machine and ct2 board

> Well, I'm just getting started with it. So far, I'm real impressed.

Yep, try your grafix software :-)

Do you have neon grafix? -> Pictures that need a half day before
are finish in 5 minutes.. Great!

>
>I have opened again my Falcon (a new pb look after), my PSU is a Skynet
>Electronics (C11 & C12 changed).

Good. That is the same type as both of mine, so the reasoning we have gone through in recent posts should apply to all of them. Hopefully this means I will be able to repair both of mine. Also, since the same type of effect can occur in any switching supply of this kind, giving several voltages but only using feedback for one of them, this is a useful principle to remember.

Always check capacitors on the output that is correct, when another output has strange voltage for unknown reasons.

That probably applies to all ST and TT supplies too, as they are quite similarily designed. I have about a dozen of these that may be fixable.

>About temperature on lattices, it's normal.

Good, but I assume you mean that this is so thanks to the cooling.
If I turn off my cooling fan for a while and then touch these chips they are very hot. (And the Falcon has bombed or locked up.)

>About my new problem...
>Since 3 days, I have another pb, I have "Coprocessor Protocol Violation" exception
>with all programs at start. The first day, after 10 mn it's good again. Yesterday
>same problem... good after 30 mn. Today this error not disappears.

I have had similar experiences, more on this follows below.

>BubbleGEM, PD, CAB, Centbench crash at start. In normal mode... same problem.
>I have looked inside, I have removed FPU, put again FPU on CT2... same problem.

This all fits my experiences, so it could be the same problem.

>Power supply is good, maybe a bad solder on CT2B or an FPU destroyed :-(

I don't think so.

>It's a 68882 33 MHz bought with my CT2B.

So was mine, but it was not the chip's fault in my case, it was the socket.

I also got a gradual 'build-up' of copro violations, rising in frequency, until I couldn't use the system. Fortunately I had seen similar things on my TT much earlier, and found a fix for them then, and the same thing worked on my CT2B as well.

Start by removing the FPU again, and if you notice any oxide on the pins, carefully remove that. Then check if you can see any oxide on the socket contacts and remove that as well. This may help a little, but it is only the 'warming up' for the real fix.

Get a very sharp needle, and very carefully use this to 'flex' each contact in the FPU socket 'inwards' (towards the center of the socket I mean) Make sure that they are all a little strained by this, but not so much that they are bent over or otherwise damaged. This requires a steady hand, good eyes, and a rich amount of patience. You must be careful all the time, to avoid damaging the connectors, and yet gain the necessary effect.

When all is done the socket should look almost exactly as before, except that each socket connector sticks out a little more from its backing, just a tiny fraction of a millimeter. That tiny fraction makes all the difference. I haven't seen any coprocessor violations on either machine since I did this.

It sounds to me as if you have missed installing HSModem or its modules
properly in \AUTO\, or that they are somehow misconfigured or damaged.

I'm not sure what machine you have, as the ports that
you mention exist both on MSTe and on TT030.

In any case, I have no MSTe, so I can only test this on my TT, and
there I do get all 4 ports displayed in the same popup.

Btw: I do hope you realized that it *is* a popup, so you won't see
all the alternatives without clicking on it.

What you then should see (on a TT) is:

Modem 1
Modem 2
Serial 1
Ser.2/LAN

In fact I see all of these even if I don't install HSModem at all,
so if you can only get Modem 2, something must be seriously wrong.
Unfortunately I can't see what that could be caused by at present.

Hi Raymond,

on Thu 17-06-1999 01:50 guitarra@afn.org wrote:

>I am quite sure that without a modification a Falcon can not do more than 19200 (14.4)
>try setting your port to 19200.

No, that is quite wrong.

An original Falcon does have a 16MHz CPU clock, and the 68030 CPU does have
its internal cache, so a standard Falcon used wisely is as fast as an MSTe,
and for some things quite a lot faster.

By wisely I mean that you should choose a good balance between the screen
resolution and the raw CPU speed you want for your system. VIDEL is very
good at blocking the CPU from ST-RAM accesses, and at very high resolutions
(esp. on a VGA monitor) the Falcon will creep along at a very low speed.

Switch to a lower resolution with fewer bitplanes, and it's like you get
a brand new machine, several times faster than in the rez you just left.

There is absolutely no problem using even an unmodified Falcon at serial
rates of 57600 or even higher. I have done so. But you must limit your
screen modes for this to be reliable.

Possibly your mistaken assumption is also derived from the fact that the
old MODEM.CPX refused to offer anything above 19200. Use the SERIAL.CPX
from the STinG distribution package instead, and get rid of MODEM.CPX.
(If both are used the old one may disturb the settings.)

Hi Phantomm,

on Thu 17-06-1999 03:42 Phantomm wrote:

----- snip ----- re: messing with the CT2B Falcon
>
>The Speed is awesome.

That it is.

>I can now do 640 x 480 TC with no problems.
>At the moment I'm in 640x480 TC with a virtual screen of
>800 x 600.

Virtual screens seem impressive at first, but they quickly
become a PITA, with all that sidescrolling. Even a slightly
lower rez feels better when you are spared that .

What you can get varies with the monitor, and the rules are
entirely different for VGA and PAL (TV timing) monitors.

On the latter even an unmodified Falcon can have pixel widths
of 1600 in TC. (No I am not kidding. It was unstable, but worked)
But the price of that is heavy interlace flicker.

On the VGA the best I have had was 768x576, which is close enough
to the virtual rez you use to make you happy, but it will require
a very flexible multisync monitor, and a lot of 'fiddling' to get
it right.

>Also I have a port speed setting of 57600!

I use 76800 on the fixed STinG connection to my TT (which has the modem).

Much higher speeds are also possible, but their usefulness depends on
what you have at the other end. My TT has to handle both the modem
(on Serial 2 at 115200) and the link to the Falcon, so the speeds
used on the various ports are a compromize between what the computers
and the ports can manage, and what standard speeds the modem accepts.

>No Problems! Haven't tried anything higher yet. :)
>
>With the settings above It is still very much Faster than
>stock Falcon in 16 colors 640 x 480. Feels 3-4 times Faster.

Feelings are elusive, and not well quantized.
A 'feeling' of 3-4 could mean anything from 2 to 6.
The best way to know is to measure it instead, and one

of the easiest ways to do that is to use NemBench.

>This is in Tos 4.04 Turbo. NVDI Not Installed!

I recommend that you do install NVDI. As you get used to
the higher speeds you will notice that it still makes a big
difference, and the font system is not to be despised either.

Also, without NVDI you can't use TOS 7.x mode at all,
as the normal Falcon VDI does not allow the blitter to
be turned off (as it must be with FastRAM active).

>6.4 Gig 2.5 IDE is much faster too.
>
Everything is. That is one of the nice features of CT2B.
With some other accelerators (eg: AB) there is something
that is somehow slowed down (for AB it is ST-RAM access).

>I will need to add another Fan.
>
That was expected..., and I suppose that is why you only
give speed examples for TOS 4.x mode, as the 7.x mode is
probably not usable for you without cooling the ispLSI
chips, like I also had to do.

When you do get that to work you can start experimenting
with *real* speed, as most programs execute in FastRAM.

>Still haven't solved the Hanging on the SCSI drives in Turbo
>Modes yet. But I left all my wires from the cables very very
>long. I expect better results when I shorten em up.

That could help. At these signal frequencies cable length does
matter, and usually in a negative sense.

>When the SCSI hangs in turbo mode.
>HD Driver only displays SCSI 0 and that drives identification
>name is mixed up with my other SCSI devices names.
>
>Like this.. SCSI 0.0 SEa onner/ meg

Are you sure this is only due to the computer as such. That looks
more like what you can get sometimes when using two drives
with the same id. Both drives receive the command, and try
to reply, but the result is a mess.

I do not see how bad timing between CPU and SCSI chip could cause
the latter to send a single command to two different SCSI ids.

Hmmm. SCSI drive select is sent as a one-of-eight pulse on the
SCSI bus data lines, so this could be a pure hardware fault.
Is your SCSI chip socketed ?

If there is bad connection in a socket, then it can lead to
dubious logic levels on some lines, so that some drive can
mistakenly think that it was selected, as well as the one
that really was. This would be more likely to happen in
turbo mode, because signals have less time to stabilize.

>When in normal Falcon mode. SCSI works fine. and when booting
>all SCSI numbers and device names are displayed as they should be.

It could still be hardware, as everything gets more critical when
running at higher speeds. Even the DMA chip is accelerated by 56%.

>Could the problem be that my main SCSI cable is too long for
>TurBo Mode? I have to take the cable off of the Falcon before I
>can use Turbo Modes. Leaving the Cable on with the power off
>on the Mid Tower, causes the system to hang right after the
>IDE drives info is displayed with HD Driver.
>Take the SCSI cable off and no problems at all.

That could be one reason, and correct termination matters too.
I suggest you look over all the hardware, and (if possible)
try with other cables too.

What is the length and type of the cable you use now ?

Hi. I remember an older game that was released in the UK but never made over into the US. IIRC, it was called "dreadnots" (sp?) or something like that. Basicaly it was about ship to ship combat during the late first world war/early 2nd world war. Does anyone have a full copy of this for sale (docs, disks, etc) and do you know if it works on a Falcon? Thanks!

Hi Doug,

If you click anywhere in the map window a new location can be created and linked to other locations. You need to know the name of the other locations as there is no graphical way of linking them. Creating a map of U.S.A this way would take years as every town and road junction has to be entered.

If you renamed the Britain.MAP file to something else you could create an empty map in a text editor and then add a few towns and roads just for fun.

Routefinder uses its own grid system and I don't know if it would be easy to convert from one of the more convntional grid systems (UTM, OSGB or LatLong) to this grid to speed up the data aqcuisition.

On a subtly different subject...

A few years ago I was given the job of getting the various departments of the company I was working for interested in Geographical Information Systems.

At the time GIS systems where quite primitive and were designed for use by utility companies and were not suited to environmental data. However, I do remember that an Edinburgh (Scotland) based company called GIMMS had a GIS for the Atari ST. Did anyone ever see or use this system ?

I don't know if the company is still in existance. It's probably another piece of sofwtare that has been lost.

Regards,

Peter.

Yes, speed in TC rocks :) but you can use any other higher
resolution, example 928*608*256 or some else. Fine working!

> I will need to add another Fan.

Yes, take a better quality fan. (a silent one..)

> Still haven't solved the Hanging on the SCSI drives in Turbo
> Modes yet. But I left all my wires from the cables very very
> long. I expect better results when I shorten em up.

Try to shorten the bus. Some OLD devices are not working well.
See last message.

> When the SCSI hangs in turbo mode.
> HD Driver only displays SCSI 0 and that drives identification
> name is mixed up with my other SCSI devices names.

Yep, that shows that the bus stucks
Try to test it with another scsi drive.

> Like this.. SCSI 0.0 SEa onner/ meg
>
> I have 4 SCSI drives on the SCSI port. 2 hard drives and
> a CDrom and CDR. They are in a Mid Tower Case.

My first step was to remove a old IBM drive from my scsi bus.
After that the bus works fine. Not one free id left :)

> When in normal Falcon mode. SCSI works fine. and when booting
> all SCSI numbers and device names are displayed as they should be.

Yes, but not in turbo mode. Same experiments as here last november.

> Most of the time the SCSI drive 0's LED comes on and stays on
> when this happens. Its a Seagate 1gig SCSI drive.

Bus reset eliminate that..
(Done by reboot the machine)

Look witch drive leave your bus stuck, remove it temporary, try agin.

Regards, Robert

PS: Today i "repared" another ct2 falcon from a german here..
IDE doasnï¿½t work..
Machine doasnï¿½t run in turbo mode..
No SCSI access..

What i have done:
Install NVDI new
Remove some fucking (senseless) .cpx modules
Replace general cpx with the latest release if i have here
Installed HDDriver new

Switch the fucking blitter of!!

And last but not least, wrot a new flash to the board..
Create NVRAM settings -ALL- new (master reset)

and as result, the machine works perfektly in turbo mode now
with exactly the same hardware as before.

After a new cold boot, machine starts perfectly with tos 7.x
Cecile and HDDriver access to a 10 Gig IDE with 20cm IDE flat wire.

This surely sounds like a SCSI timeout. Look in the Centek Manual. If
their board does not adjust the DMA timing properly for your
motherboard, it states you should contact them (after making sure your
DMA wire takes the shortest route to the DMA pin, and not routed over
other chips, or near the memory board. Rev G/H boards react quite
differently then Rev K, which I have found are generally harder to get
the SCSI DMA timing properly adjusted.

>
>>It's a 68882 33 MHz bought with my CT2B.
>
>So was mine, but it was not the chip's fault in my case, it was the socket.

That's right ! D19 (pin 47) was not connected to CPU and two buffers
in front of FPU. But it was not a bad connection between FPU and socket,
it was a bad solder between socked and card (no possibility to made
a new solder). I have push socket on card !!! and now it's OK. If I have
again this problem next months, I think put a pin between FPU and socket
and connect a wire to buffer.
Thanks for your help.

> replace the inoperative blitter control function of Falcon TOS
> with an operative one, so that hardware blitting can be fully

It has never been possible to actually turn off the blitter (it doesn't
do anything if you don't ask it to). That function only tells the VDI
(and/or possibly the LineA routines) not to use it.

> disabled, as the blitter is unreliable at 50 MHz. As yet I have

You mean it would be possible to blit from FastRAM on the CT2 if the
VIDEL had been clocked lower?
Or is there something similar to the VDI patches in the latest AB040
Toolkit versions (blits from FastRAM are intercepted and the data
copied to STRAM)?

> only found NVDI able to do so. Can fVDI do this too ?

The current fVDI device drivers have no support for the blitter at all.
It doesn't matter if your machine can 'enable/disable' it or not.
On the Falcon the blitter was next to useless, anyway, but perhaps some
things could have been a little faster on the older machines if I had
supported it.

> If not, then I will have to use it in combination with NVDI.

Actually, that wouldn't help since NVDI would leave the blits to be
handled by fVDI. Only some higher level things are done by NVDI when
it's in the foreground.

>As VDI contains both types of functions it may still be worthwhile
>to consider alternative speed-optimized interface methods. If even

Even now the interface to the acceleration routines is different for
each one. Currently the calls go via intermediate subroutines, though,
which save all registers, do some parameter modifications (such as
x1,y1/x2,y2 -> x,y/w,h conversion) and in some cases handle potentially
unimplemented 'extensions' (for example multi pixel set).
Some of these things are done for historical reasons and others just
for simplification. I intend to 'streamline' the interfaces later on.

764. Attention Atari Users and Programmers!!!

Newsgroup: comp.sys.atari.st
Date: 1999-06-18 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <Sgha3.4902$NA2.334976@news1.telusplanet.net>
Source record: 76997

This notice is to inform everyone of the MGC '99.

In this email:
Genereal Information
The Rules
The Prizes
The Deadlines
The Sponsors

General information:

This is the first annual MagiC Online, in conjunction with The X, MagiC programming competition. The judges will be the Atari community. All entries will be available for download on December 5th, 1999. At this time, voting sheets will be made available to the general public. The winner(s) will be notified on Christmas Day, December 25th, 1999. This means that all nominations must be recieved by December 24, 1999.
The goal is to create the best possible conversion of a classic game. Examples would be conversions of Asteroids, pacman, frogger. A list of many possible conversions can be viewed here. The catch is however, that the game must be created to run perfectly under MagiC in a GEM window.

The Rules:ï¿½

* All interested programmers and/or groups which feel that they might be interested in entering this competition must e-mail one of the organizers (Bengy Collins <collins@bulli.com>, Jan Daldrup<thex@atari.org>) and confirm their registration. Remember, registration is free, but we need it in order to set up prizes and determine if this competition should be cancelled or not. The Entry deadline is September 15th 1999! NO REGISTRATIONS WILL BE ACCEPTED AFTER THIS DATE.
* The new system calls in NVDI can be used only as enhancements to the game. The game must be fully functional on bare (Standard) MagiC configurations. However, the game is allowed to take advantage of system extensions as long as the extensions are freely available. Example: BubbleGEM
* The game must be fully functional in ST High resolution /AND/ support at least a 16 color or greater video mode.
* As this is a MagiC programming contest, the game must attempt to use extensions such as BubbleGEM whenever possible.
* The game must either be shareware or freeware. However, if the shareware path is chosen, the game can not be crippled in any way.
* The game must come with documentation. ST-Guide and Text versions are acceptable.
* Game control will be one or more of the following: Keyboard, Mouse, Joystick, Joypad.

* Sound and music can be used using XBIOS calls, thus allowing
compatibility with MagiC PC. GEMJing may also be used.
* The game can not be officially released until Competition judging
(December 5th, 1999). Games which are released before the end of the
competition and games which already exist are disqualified.
* Any individual or crew may submit as many programs as desired.

The Prizes
First place: 250$ American
Second place: 150$ American
Third place: 100$ American
We are working very hard trying to get a prize for all entries. Producing a
game is a very long and difficult proccess, and we believe every attempt at
it should be recognized!
Further sponsorship might possibly add more prizes to this list.

The Deadlines!
Entry Deadline (All this requires is an e-mail!) September 15th, 1999
Competition Closes on December 5th, 1999. All Games must be received by
this time!
Nomination Deadline is December 24th, 1999. All vote forms must be sent in
by this time.

Sponsors
All money raised for prizes is generated from the *2* Banners on the
official MGC '99 page and the MagiC Online Main Page! Failure to support
these banners will simply force the competition to close. (We recieve
10cents per click, and we have 6 months to raise 500$)

Is your Falcon an Atari Falcon or a C-Lab Falcon? Would you be interested in taking in a Jag+CD system with games as partial trade-in?
Thanks,
Sam

766. Nova / NVDI problem...

Newsgroup: comp.sys.atari.st
Date: 1999-06-18 00:00:00 UTC
From: tkross@oio.net
Message-ID: <929672272.913.92@news.remarQ.com>
Source record: 76999

I ran a program today that reconfigured certain NVDI drivers.
Now I can't use NVDI (4) with my Nova (ET4000 - early drivers,
I believe) card, using Magic 4 as an OS. Basically, if NVDI is
active, I can only get output from the Nova Emulator program.
I seem to remember that the NVDI drivers had to be installed
after the Nova drivers. Unfortunately, I can't reinstall NVDI
as both my Master and Work disks have sector or CRC errors, and
I can't remember which NVDI system file was supposed to be used
with the ET4000 so I can't change things around manually in the
GEMSYS folder.

Anyone have any hints? Perhaps you could email me the appropriate
NVDI file?

Thanks,

Terry

The game system, NEW, is now selling for $35US with one game. Any attempts to
sell above this price are a wast of bandwidth.

768. Dungeon Master

Newsgroup: comp.sys.atari.st
Date: 1999-06-18 00:00:00 UTC
From: tkross@oio.net
Message-ID: <929673217.675.79@news.remarQ.com>
Source record: 77001

After following the thread on Dungeon Master recently, I decided to try to fix mine, which had the boot sector overwritten many years ago by a virus. I restored the bootsector with UVK2000 and it works fine, but I'm curious about two things:

1 - Where can I find a list of the spells? I kept the docs for a many years, even though the program didn't work, but I eventually threw them away about 5 months ago, when I moved (typical....).
2 - I noticed that someone said that DM was useable on all Atari systems. However, while it _runs_ on my TT, it doesn't display properly. Instead of going into Low Rez, it puts up two side-by-side screens that appear to be complete, but are too small to read. It runs fine on my STe, but I don't have an AC cord for that, and I don't want to physically remove the cord from my TT just to play a game. Anyone have any idea how I can get it to display properly on my TT? - Incidently, this happens even when I boot from the disk and don't load any Auto programs or Accessories.

Thanks,

Terry

Message-ID: <7kca4l$2h9r@enews1.newsguy.com>
Source record: 77002

Just a little note to let everyone know that I've put up all the "data disks" for use with the Atari Strip Poker game that Chris "CRACKERS" Cracknell created. I think I saw here that someone else was also putting these up on a site, but in case that hasn't happened, you can find everything at Nurmix Web Central.

And I've also added 2 "interactive / erotica demos" for the ST/STE. They're a bit older, but are still pretty interesting. They contain pictures, stories, and other information.

And I've also put up "The Ultimate Musical Experience" - which is an amazing sound and music demo for the STE, as well as the demo version of the STE/Falcon pinball game, "Obsession". And I've also put up both versions of Magic Shadow Archiver (MSA) since it is needed to create the floppies for a few items here.

So, head over to Nurmix Web Central (You'll find all this stuff in the ATARI section):

http://www.tsotech.com/nurmix/home.htm

And while you're there, if you have a warped sense of humor, check out "THE ZARSISIPAN FILES" or "DEEP THOUGHTS by Jack Handey".

-Paul

Eh ?
I'm not sure if I understood you correctly here.
Do you mean that removing the internal keyboard makes the lattice
chips grow hotter than they were with internal keyboard installed ?

----- snip ----- re: Coprocessor Violation
>>

Right. Attempts to resolder this kind of socket is very dangerous.
It certainly can't be done safely with ordinary hobbyist tools.

>I have push socket on card !!! and now it's OK.

I think that can only work temporarily. Vibrations will see to that.

>If I have again this problem next months, I think put a pin between FPU
>and socket and connect a wire to buffer.

In this case I think that is the only acceptable solution. Knowing that
the pin is loose I would not wait for new disasters to fix it. Do it now
so those disasters never happen. The only good crash is one avoided ;-)

>do anything if you don't ask it to). That function only tells the VDI
>(and/or possibly the LineA routines) not to use it.

That was of course what I meant by 'turning it off', as the Falcon TOS
routines do not allow even that. If you call the routine that would
turn off the blitter usage flag, then one of the internal subroutines
repatches that argument so the flag is still set at exit from the call.

The main blit dispatcher that was used in other TOS to switch between
hard and soft blit routines is still there, but the flag is locked
active, and the soft-blit vectors only point to dummy code.

That is because there are no software routines in the Falcon that can
do the blitting job. This is the only Atari TOS that lacks such code.

>> disabled, as the blitter is unreliable at 50 MHz. As yet I have
>
>You mean it would be possible to blit from FastRAM on the CT2 if the
>VIDEL had been clocked lower?

No of course not. The address registers are only 24 bits wide,
so the blitter can never access FastRAM. But Centek claim that
that is the only blitter problem, which is not true here.

What I mean is that even blitting in ST-RAM often goes wrong in
the turbo modes, which should not happen if Centeks explanation
was the full truth. I must disable the blitter in TOS 4.x too
to avoid that problem, even though no FastRAM is active.

>Or is there something similar to the VDI patches in the latest AB040
>Toolkit versions (blits from FastRAM are intercepted and the data
>copied to STRAM)?

No. The only way to 'blit' anything from or to FastRAM on a CT2 is by
a software implementation of the blitter, such as that of NVDI. It is
to ensure that this is also used for all blitting that the hardware
blitter flag must be disabled, as NVDI does allow either soft or hard
blitter to be used, depending on the state of that flag.

>> only found NVDI able to do so. Can fVDI do this too ?
>
>The current fVDI device drivers have no support for the blitter at all.
>It doesn't matter if your machine can 'enable/disable' it or not.

Excellent. This means that regardless of the state of that flag fVDI
will never use the blitter hardware, which is ideal for the CT2, and
probably for other accelerators with FastRAM as well.

That would solve both the problem that Centek admit, the FastRAM specific
one, and the one that I suspect, which is that the blitter simply misses
even in ST-RAM at 50MHz clocking.

>On the Falcon the blitter was next to useless, anyway, but perhaps some
>things could have been a little faster on the older machines if I had
>supported it.

I don't think so. I know that on all accelerated machines where I tried
it the NVDI soft-blit routines were faster than the hardware blitter.
On an unmodified 8MHz machine, there may have been a slight speed gain
in using the hardware blitter, as compared to NVDI soft-blit, but it was
not much.

>> If not, then I will have to use it in combination with NVDI.
>
>Actually, that wouldn't help since NVDI would leave the blits to be
>handled by fVDI. Only some higher level things are done by NVDI when
>it's in the foreground.

But that is really excellent! I do want NVDI for its GDOS stuff, but
I didn't like that it still allowed programs to turn on hard blitting.

Do you really want someone to tell you ? I mean, if you've forgotten
that much, then you have an opportunity of reliving the experience
of discoveries again. Do you really want to miss out on that ?

I do have the spells (most still in my head even), and I'm sure lots of
others do too, but I'd think it over if I were you. If you do 'read up'
you have lost a unique opportunity. The same goes for map studies.

The object shouldn't be to get through it as fast as possible,
but rather to get a maximum of enjoyment out of playing the game.

>2 - I noticed that someone said that DM was useable on all Atari

> to read. It runs fine on my STe, but I don't have an AC cord for
> that, and I don't want to physically remove the cord from my TT just
> to play a game.

The entire problem is simply that the TT reset conditions activate the
TT-Medium resolution rather than ST-Low, which was used on all ST systems.
DM does not contain any code to set initial resolution, so it just assumes
that the boot rez must be ST-Low. This has the same bitplanes as TT-Medium
so colours are correct, but only half the line width so all even lines end
up at the left edge, with the odd lines at the right edge of the screen

That is what makes it look like two screens side by side, but actually
both of them only has half of the lines.

This can be easily fixed, and I understand that you want to be able to
run DM on your TT too, but come on, I won't buy that AC cord story...
How hard can it be to get another AC cord ?

> Anyone have any idea how I can get it to display
> properly on my TT? - Incidently, this happens even when I boot
> from the disk and don't load any Auto programs or Accessories.

It is impossible to boot a real DM disk with Auto programs and ACCs,
as it uses a bootsector loader.

Anyway, here is one way you can boot an original DM or CSB disk on the TT.
What you need to fix the display is simply another bootsector diskette,
which first switches rez and then allows you to switch disks to insert DM
from which it then loads the bootsector and executes it exactly as if that
had been done directly after reset, with ST-Low as reset rez.

But for using an old program on a 68030, it may also be safest to turn
off cache, as most old programs really dislike caching, especially in
timing dependent floppy routines. In fact I definitely advice against
trying to format any diskettes using the commands in DM, as even the
32MHz clock without caching is probably too high to do that safely.
Reading and writing preformatted game save disks should be ok though.

And TT-RAM is another thing most old game programs hate, as they really
were made for a 24-bit address bus, and may need the address space to
be 'shrunk' to that size.

In the 'File' menu of my homepage you can find a program that will do
all of the above, and will also set memory size of your system to one
of the 'normal' ST sizes, which some games care about (DM doesn't).

The program is named B030, and has been tested with original DM disks
as well as original CSB disks. Some of its functions are intended for
Falcon, but those will be blocked from affecting a TT. You use the
programs supplied in the archive to make your own B030 boot diskette,
and then you use that to boot DM (or CSB if you have it). You don't
need to activate any special commands, as the defaults are suitable
for booting DM. (ST-Low, Cache off, 24-bit bus (via PMMU))

One word of warning though. The 'cracked' versions, that many people
now throw around as if emulators on PCs had made them legal, do not often
work well on 68030 systems. That is because the 'packers' or some code
patches use methods that simply do not work on a 68030, such as patching
68000-specific frames on stack etc, or doing things that simply have no
effect on an ST, but modifies some new hardware register in a TT, and
thereby locks up the system.

Although I have originals myself, I have tried 'cracked' versions too
on my TT, to see what will work and what won't, and to date not one
of the cracked DM or CSB versions has run reliably on the TT, though
the originals work fine. Some of the cracked ones seemed to work,
but after getting a bit into the game all four heroes suddenly die,
which is obviously a case of failed cracking.

So if you do have originals (as I think you do), go ahead and enjoy...

It has happened. :) It's currently in
http://www.bassment.demon.nl/hentai/ but there's no page or anything
yet, just a directory with some files. I had no time to make a new site
for it but I wanted to ensure their availability. :)

I'm working on the all new "Atari Fetish Site" which will have these
available for download, and also some promising snap shots and stuff. :)

Got CAB 1.5 with STIK running on a 8mhz / 2 meg 1040ST.

It is possible, and works relatively well. (Especially for 8mhz)

Sure, go ahead and send that to me. Do you have a simple version of
GDOS to send with it?

And as far as that goes, does anyone know of a telnet client that works
with STIK that does not require GDOS?

I guess I'll have to eventually burden my poor 8mhz system with
multitasking software.....

>of discoveries again. Do you really want to miss out on that ?

Actually, I didn't really mean "a list of spells" in the sense of a complete list. I was referring to a list like they had in the manual, stating what the basic symbols were. I enjoy figuring them out myself, but I'd even forgotten how to make light (I've found that one again through trial and error). I'm not looking for hints (and absolutely not maps), per se - because I enjoy playing it myself, I just consider knowing what the symbols represent a bit of a prerequisite.
>
[snipped]
>The object shouldn't be to get through it as fast as possible,
>but rather to get a maximum of enjoyment out of playing the game.
I agree with that wholeheartedly. However, it shouldn't be causing frustration due to not having something that I once had, and came with the game :)

[snipped]

>The entire problem is simply that the TT reset conditions activate the
>TT-Medium resolution rather than ST-Low, which was used on all ST systems.
>DM does not contain any code to set initial resolution, so it just assumes
>that the boot rez must be ST-Low. This has the same bitplanes as TT-Medium
>so colours are correct, but only half the line width so all even lines end
>up at the left edge, with the odd lines at the right edge of the screen

Ah, yes - thanks. I knew about that, come to think of it. But I very rarely play games and almost never use any Low Resolution programs (at least ones that I can't access from the GEM desktop) so I forgot about it.
>That is what makes it look like two screens side by side, but actually
>both of them only has half of the lines.
Actually, I saw that, it was just easier to phrase the other way.

>This can be easily fixed, and I understand that you want to be able to
>run DM on your TT too, but come on, I won't buy that AC cord story...
>How hard can it be to get another AC cord ?

Actually, it's harder than you think :) - I am currently jobless, live
15 miles from the nearest town, and the alternator on my car caught on
fire (why do you think I suddenly have time to play an old game?
<grin>)
[snipped]
>It is impossible to boot a real DM disk with Auto programs and ACCs,
>as it uses a bootsector loader.
Well, yeah - true - there is that :)

[Snipped section relating to Boot Res., cache, TT RAM, and B030]

>So if you do have originals (as I think you do), go ahead and enjoy...

OK, thanks for all the information. I'll check out B030. Yes, it's
an original. I never did get CSB, because I never completed DM before
it was hit by the virus (did get down to the last, or penultimate
level though). Since I was on a polar icebreaker, down in Antarctica,
when it happened, I just put it away, and never got around to trying
to replace it. From what I heard, CSB required the DM disk, so being
only an infrequent gamer, I decided it wasn't worth the trouble -
although now, I wish I had it :)

Thanks for all your help.

Same here. Even with a Nemesis accelerator. I just boot up with the DM (and
CSB too, for that matter) disk in, and it runs. Faster, but it runs. Oh, the
one thing I've always had to do was go into NVRam and set it back to ST-LOW,
because I had changed it. ;-)

->
->Terry

Thats not quite right. You do not *have* to have the original DM disk
to play CSB. However, the game is so much harder, right from the start
that it is highly recommended that you transfer a team from DM that had
beaten Lord Chaos, or was at levels where it could (having 4 "master"
level characters sure did help me!) ;-)

Later...and good dungeon adventuring!

I was using ScreenBlaster 2 external hardware before I installed
the CT2B. I could do 1280x960 in 16colors. I usually used this mode
with a virtual screen of 1280 x 1280. No sidescreen scrolling. Just
up and down abit. Didn't bother me at all.
Also, I could do 800x600 in 256colors and abit higher 9??x7??.
No problems with screen flicker in any of these modes.

I've not done the VGA adapter modification yet. Should I expect
to get 800x600 in 256colors or TrueColor without the VGA adapter
modification?
I'm just wondering about what kind of extended resolutions I will
miss if this isn't done. The docs don't say.

I could never use 57600 with STinG before the CT2B.

True, I've never put it to the test yet. Will try NemBench soon
and see what I've got.

Yes, NVDI should give more speed.
I really have not had the time to install everything yet.
Going to take my time and do it right.
I'll have to install another Fan and probably shorten up some
of the wires abit. Then after that, I'll get around to installing
more software and such.

Well, I've went as far as to try and boot into Tos 7.x but
didn't have NVDI installed so no blitter control. It would
do the Ram and Fast Ram testing and etc. But I think it will
Bomb if NVDI isn't installed to control the Blitter.

It could be the termination. I have the CDR as the last SCSI
device in the chain. It is not terminated. If I put termination
on it. The Falcon will not boot the SCSI drives. I noticed this
before installing the CT2B. I'll go thru all the SCSI devices
asap and check Termination. I may have to switch some drives around
to get it right.

This SCSI trouble is probably just something simple. Thats why I
want to get that straighten out First before installing more
software and etc.
>
>What is the length and type of the cable you use now ?
Not sure what Type it would be, But it is at least 5 feet long.
Thats not counting the Scsi connecting ribbon cable which is at least
2 Feet long. I know this probably seems long, But I've never had
a problem with my SCSI drives with this length of cable.
I bought the SCSI cable from Toad Computers for the Falcon.
But it may be to long for the Turbo modes. It's the only SCSI cable
I have at the moment.

Great, I've not really tried the higher resolutions yet, because
I've not did the VGA adapter modification yet. So I don't know
if I can go that high without the modification being done.

>Yes, take a better quality fan. (a silent one..)

Where would you recommend the Fan be located?
And does the CT2B Fan need to be on the heatsink or should I move
it over the other chips on the CT2B board?
I thought about putting a Fan over the Powersupply.

But I'm not sure where the heat trouble is. Is it the CT2B board
its self? Or the PowerSupply heat?

Most of that I've already done. I'm just running the bare necessary
software and only in Tos 4.x Turbo until I find the SCSI problem.
I'm sure its something simple.

>Mike
>.

Hi Mike,

Well my SCSI cable is at least 7 feet long with a ribbon cable of
at least 2 feet long. I've had no problem with this length of cable
in the past.

Also, I did leave all the CT2B cable connections long on purpose.
So that DMA wire may be the trouble.
I'll also have to check the termination on all the drives.
My CDR drive is last in the SCSI chain and is not terminated as far
as I know. When I enable Termination on it, The SCSI drives will not
boot. This happened before the CT2B installation. Every thing seems
to work fine without termination on the CDR, before the CT2B
installation.

Not sure what REV my board is, I'll have to check that also.

I've 3 or 4 things to check, but its probably just something simple.
Cables too long, Termination not set right, or etc.

I'll go thru it all asap.

Thanks,
phantomm@kih.net

Hiya Ron,

Well, thanks. That's a nice offer. I don't know if I really need
it all, but it couldn't hurt. I've replaced my alternator, and now
have a working vehicle again. I've had the May issue for about 6 days
now, with no way to get into town to copy it (I've also got a
duplicate master of February). How about a trade? You send me a copy
of the DM manual, and I'll pay for your copies of the June ST+.
>

Noted. As I said, I wasn't really into gaming that much - I just knew
that you were supposed to have DM before playing CSB. :)

Thanks!

Terry

Hello Tony,

I used to have a problem with version 2.5 of CAB which might also apply to your set up. I found on my ST that it would only work if I started CAB before conecting to my ISP but when I got a Falcon I found that I had to coonect first or CAB would bomb. I don't know if your problem might be similiar but it might be worthwhile connecting first and then starting CAB of if this is what you normally do try starting CAB and then connecting.

Yours,
David James

>this anyway to print from CAB.

There are some old programs that need GDOS and won't work with NVDI4 such as the DTP program Timeworks2. I suggest you get a copy of GDOS and keep it handy on the basis that if you've got it you won't need it but if you haven't there's bound to be a program that you want to run that does!

I have found that if you need to install GDOS you will probably need to change NVDI.PRG to NVDI.PRX so that it's switched off. Should you ever need to, mail me and I'll run through the procedure, I have to do it everytime one of the family needs Timeworks!

Hallo Jos!

JV>So printing can be done but forget the colors (not important anyhow)

Printing in colors works, too. I tried it this evening and first got stuck when the computer wouldn't respond after selecting "Vollfarben" in the NVDI dialogue. But finally, after a reboot, my DJ550C produced a good copy of the "cow.gif" that can be found in the html folder.

System: Falcon030, MagiC 5, NVDI 5.

Make sure the NVDIDRV?.SYS files are disabled by renaming them
*.syx or something. It's possible they got re-installed some
how?

Not sure how your assign.sys should look, but under some
setups with nvdi with gfx cards the lines with SCREEN.SYS
are replaced by other driver names. Maybe these got changed?

Source record: 77039

Update:

After making the mods that Ronald suggested (ALLOCMEM at 50000),
ETHER.STX, MASQUE.STX, MASQUE.HYP deleted, I have STinG 1.20 running fine
on the 1 mb STf and I can connect successfully to the ISP.

I found the 68000 CAB.OVL but it is 35,626, not 29,000 bytes. I set
RAM to 0, CACHE to 0, left images on as a trial. CAB 1.5 connected and
images worked fine for first 3 pages then lockup.

Turning images off and saving changes, I went online again and selected
our ISP homepage which loaded fine. However, a new problem has occured.
After accessing the ISP's simple homepage, the words: Formatting text...
appear in the info line at the top of the screen and disk access is
constant. After 10 minutes, the disk drive is still running. I had to
cut the power to stop it.

Repeated tries all render the same results. Not sure if cutting power
corrupted the files. Turned images on again to see if I could connect as
I did originally but the same formatting text message and disk access
again. I can't seem to get any farther at this point.

Any suggestions appreciated!

Thanks...

Source record: 77043

OK, I seem to have the jumpers correctly setup (thanks to the
NetBSD hardware FAQ) but now MiNTnet cannot seem to locate the
hardware address of the Riebl.

I recall Torsten mentioning that one has to run "ifconfig" with
the -f option to load a special hardware configuration file, but
there is no mention of the filename or syntax in MiNTnet docs.
In fact, none of the Riebl stuff is documented, nor does the
source code tell much about how to configure it or connect it.

Does anyone have the answer? Thanks.

> Great, I've not really tried the higher resolutions yet, because
> I've not did the VGA adapter modification yet. So I don't know
> if I can go that high without the modification being done.

Sure, also you can use the sreenblaster, but you not need it realy :)
CT2 / CentScreen does the same.

> Where would you recommend the Fan be located?
> And does the CT2B Fan need to be on the heatsink or should I move
> it over the other chips on the CT2B board?
> I thought about putting a Fan over the Powersupply.

Thatï¿½s a good question, i take some fanï¿½s from a local electronic store
here, ask them for fans with metal rolls inside (lager) (whatï¿½s the
right word for the german word: kugellager?) they are better, silent
as the one centek use.

> But I'm not sure where the heat trouble is. Is it the CT2B board
> its self? Or the PowerSupply heat?

Yes, thatï¿½s the best way if you use the orignal case. Forget this bloody
loud thing below the keyboad, no resuls with that..
Top of internal psu/ct2 is the best place for an silent fan.

Top of orignal plastic case got realy warm without a good fan.

> This is a fairly new drive, around a year old.

Hm..
Newer drives should be work nice, but i donï¿½t know about your drive.
You have the chance to try another drive?

> Yes it does, I just mentioned that as one of the symptoms of the
> trouble.

> >Look witch drive leave your bus stuck, remove it temporary, try agin.
>
> Its the first SCSI drive. Drive 0 the SeaGate 1gig.

Right.
Other devices works well?
You only use the seagate?
No more ideas..

> Most of that I've already done. I'm just running the bare necessary
> software and only in Tos 4.x Turbo until I find the SCSI problem.
> I'm sure its something simple.

Yep, but i have no more ideas aout your drive.
Last:

You have two solder jumpers on the smal board? (Patch board)
Named 1 and 2 ?

I donï¿½t know if the "B" release have both jumpers left..
Rev "A" manual says: try to chance this jumper with DMA (SCSI) trouble..

Regards, Robert

814. Calamus 98 and Pagestream 2.2se on IBM

Newsgroup: comp.sys.atari.st
Date: 1999-06-19 00:00:00 UTC
From: broncos@primenet.com
Message-ID: <7kg6he$5bt$1@nnrp03.primenet.com>
Source record: 77047

My Father is thinking of buying a IBM but wants to stay compatible
with my Falcon. Im wondering if Calamus or Pagestream will have a
problem printing out of a Laserjet using either Gemulator or magicPC.
I know that Calamus has the nvdi module to allow printing using NVDI's
printer drivers but how does pagestream print on another computer.
It has its own drivers so It's hard for me to logically figure how it
prints. If someone can advise me I would appreciate it.

I don't know what you mean by the small board. Ronald also mentions
a small board. My CT2B did not come with a small board.
There is no mention of a small board or Patch board in the docs.

You do have to solder some wires to the empty sockets of U62 and
U63. But there is no small board that I know of with the CT2B.
Please Explain.

Also, I can use a port speed of 230400 with STinG!!
That is Fast! Not bad at all.

As soon as I can, I will look at the SCSI problem I am having.
I just haven't had time yet to do or check anything about it
yet. I'll post something about the SCSI problem asap.

Also, can I use the ScreenBlaster II hardware in TurboModes without
the VGA Adapter Modification if you know?

I'm still not clear if I need to do the VGA adapter modification
to get higher resolutions such as 800x600 in 256 colors or TrueColor
without using ScreenBlaster II.

Thanks for your help.

----- snip ----- re: GDOS for APPs needing variable fonts
>
> Sure, go ahead and send that to me. Do you have a simple version of
>GDOS to send with it?

Most 'old and simple' GDOS versions are unfit for use with modern software.
The main reason for this is that they do not use XBRA protocol in 'bending'
the system vectors to link in their own routines.

I do have a patched version of AMC_GDOS, which I have equipped with XBRA
handling for all vector bending. I often use this when I need loadable
fonts on ST machines with little RAM.

But I am unsure of the legal position:
Is that GDOS still covered by commercial copyright, or has it been moved
into Public Domain ? Does anyone else know this ?

If legal, I could make it available for download on my homepage.

> And as far as that goes, does anyone know of a telnet client that works
>with STIK that does not require GDOS?

Yes, Peter Rottengatter's 'TelStar' will happily use the system font, and does
not require any GDOS to be installed at all. If you use it with any GDOS,
then the a menu command allows you to select other fonts to be used, through
a built-in font selector, so no separate font selector needs to be installed
to do this.

Unfortunately there are some problems with it:

1: The virtual terminal is very incompletely implemented, so many VT-100
features will not work as intended, and there is no colour handling.

2: There is some bug in the font handling, so that TelStar will bomb if
started another time, with any old GDOS installed. It is eliminated
in NVDI and SpeedoGDOS, but those tend to waste a lot of RAM for an
ST.

So, TelStar should be used with no GDOS at all, or with a modern one, such
as SpeedoGDOS or NVDI. They have special code to eliminate garbage in the
internal structures when APPs make mistakes of this kind. Older TOS don't
have that protection and assume that some of the garbage is valid pointers,
that's why they bomb with a bus error in such cases.
(Mostly they bomb when the next APP wants to 'load fonts'.)

> I guess I'll have to eventually burden my poor 8mhz system with
>multitasking software.....

You could try Geneva 6. Of all multitasking AES I know of, this is the one that gives most value per RAM cost. It does not multitask GEMDOS, but it does multitask GEM APPs, and does it quite well too.

For high speed, nothing can beat MagiC, but it costs a lot of RAM, and so does all MiNT-based multitaskers as well.

> I used DM on a falcon 030 without doing anything before,

I know it works this way, as it was one of the first game programs that I
tested on the Falcon, closely followed by my other favourites "Frontier"
and "Civilization".

>so I think DM is clean enough to run on a TT without turning off caches.

It is definitely 'clean' enough in its coding, there is no question of that,
but unfortunately some of the floppy disk operations are very time critical.

One must use a delay on the order of a few microseconds between certain
register accesses. This time is to short to use any system timers that
would be independent of CPU speed, because on a slow machine that would
cause the operation to fail. Instead such problems can be solved by
having separate routines for different CPU speeds, but DM has no way of
testing the system speed, and the need to do so did not exist when it
was written. The cookies and stuff normally used to identify machine
types to adapt to them had not even been invented at that time.

Caching will definitely affect the code normally used for these delays,
so that the delay time is much shorter than otherwise, but whether that
will cause errors or not depends on many things, including both the
exact CPU speed and the margins used in designing the delay routines.

>But I never tried formatting.

You may be correct about the cache, I'm not sure, but remember that the TT
is a much faster machine, running at 32MHz with 32 bit bus, while a Falcon
only runs at 16MHz, with 16 bit bus. This means that raw speed of a TT
is always more than twice that of a Falcon when running the same code.
That would affect the delay routines mentioned above by causing delays
to be slightly less than half of those on a Falcon.

If the FDC status register is read with a too short delay since the last
command was written, then the result returned will be garbage, having no
proper relation to the result flags expected...

Still, it is up to each user to decide if he/she wants to risk writing to
the game save disks with caching active. I'd advice frequent backup though.

Ah yes, that is different of course. It really adds to the adventure spirit too, if you have both the english spelling and the rune images of the spell words in your mind while playing. I even found myself feeling almost as if I were shouting these spells at the monsters in the fights. (Especially having played it 10+ hours at a stretch.)

>I enjoy figuring them
>out myself, but I'd even forgotten how to make light (I've found that
>one again through trial and error).

If you mean the spell for a flame, that is given by a clue early on, which you do need the symbol list to interpret. True light is another spell though, which comes much later in the game.

>I'm not looking for hints (and
>absolutely not maps), per se - because I enjoy playing it myself,
>I just consider knowing what the symbols represent a bit of a
>prerequisite.

Yes, it is, because all clues are given in english, which can't be used for casting the spells. That has to be done with runes.

----- snip ----- re: how to enjoy the DM game best
>

Only a few of the old games are really worth replaying today, but DM
and its followup CSB are definitely in that category.

----- snip ----- re: the trials and tribulations of AC cord procurement ;-)
>
>Actually, it's harder than you think :) - I am currently jobless, live
>15 miles from the nearest town, and the alternator on my car caught on
>fire (why do you think I suddenly have time to play an old game?
><grin>)

Hrrrmmm, well, it does seem as if your difficulty in getting another
cord is more than a 'smidgen' above average, I can't deny that.

Still, let's try to look at things from the bright side, after all,
you did get an opportunity to try DM again. Things could be worse. ;-)

>OK, thanks for all the information. I'll check out B030. Yes, it's
>an original. I never did get CSB, because I never completed DM before
>it was hit by the virus (did get down to the last, or penultimate
>level though).

Actually you don't need to complete DM to move your heroes into CSB,
but they will normally arrive in CSB much more powerful if they have
beaten all the heavy resistance in DM, and aquired certain objects.

During the timetrip (through a game save disk) to the new dungeon far in
the future, the heroes lose all physical possessions, but some of them
(if used correctly before taking the trip) will transform into similar
enhancements of the heroes' own characteristics.
(Wisdom, Mana, Strength, etc.)

>Since I was on a polar icebreaker, down in Antarctica,
>when it happened, I just put it away, and never got around to trying
>to replace it.

Interesting circumstances, and I see there was not much to be done.

>From what I heard, CSB required the DM disk,

That is not correct. You can start the game with heroes found in a
special gallery (not inside the dungeon itself), but those heroes
are not as strong as you can have made your DM heroes. They are
immensely strong compared to the starting heroes of DM of course,
but no match for the ones you should have developed towards the end
of the DM game. So it is better to start with a DM game save disk.

The DM game boot disk is never involved in the transfer, so you can
even exchange starting heroes with others simply by exchanging the
game save files over Internet.

>so being only an infrequent gamer, I decided it wasn't worth the trouble -
>although now, I wish I had it :)

I've seen it mentioned a few times in 'Games for sale' posts, so you
can probably find it somewhere. It is definitely worth it.

Like DM, but even more so, so to speak. "Here there be dragons". And that plural form is definitely intended. Go for it. I'm sure you'll like it.

Now, as to the spells. As you already know there are four categories of runes, and each spell consists of at least one each from the first two categories and more complex spells add a rune of the third category, while the most difficult spells add one from the fourth category.

I'll try to illustrate the runes below, but due to limitations of Ascii, some will be very rough representations, but you will recognize them in the game.

Also, some of my terminology may differ from the original manual, as I gave away my own manuals to a niece several years ago. My terms do fit the way the runes work in the game however, so those minor differencies should not matter.

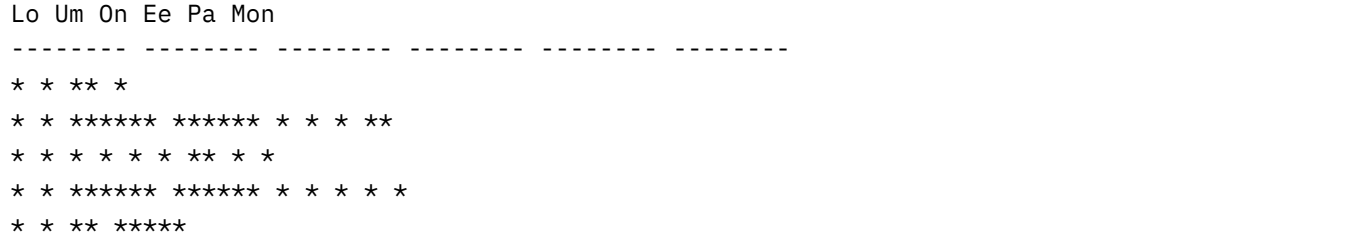
The first category defines the strength of the total spell, and will work as a multiplier for the Mana cost of casting the spell.

A very few spells do something not dependent on strength, so it would be very wasteful to use a strong power rune for such spells, but in most cases the strength of the first rune can decide life-or-death issues.

The runes, in rising order of power and mana cost are these:

Number:	Name:	Meaning:
1	Lo	Lowest power and cost factor
2	Um	2nd power and cost factor
3	On	3rd power and cost factor
4	Ee	4th power and cost factor
5	Pa	5th power and cost factor
6	Mon	Highest power and cost factor

And they look as shown below:



The second category defines the element of the spell, and mostly this means that the spell somehow invokes that element, or one or more of its characteristics.

Their runes in rising order of mana cost are these

Number:	Name:	Element and characteristics:
1	Ya	Earth == Solid, enduring, strong
2	Vi	Water == Fluid, nourishing, potable

3 Oh Air == Gaseous, transparent, invisible
4 Ful Fire == Fiery, burning, temperamental
5 Des Void == Empty, absent, desolate
6 Zo Chaos == Chaotic, random, unbound

And they look as shown below:

```
Ya Vi Oh Ful Des Zo
-------- -------- -------- -------- -------- --------
***** ** * *** ** **
* * * * ** * * ** * * * * *
***** * * * * * *** ***
* * * ** * * ** * * *
***** * ** ******* ***
```

The third category (when used) directs or modifies the action
or activity to be caused or interfered with by the spell.

Their runes in rising order of mana cost are these

```
Number: Name: Meaning:
------- ----- --------
1 Ven Poison
2 Ew Monster
3 Kath Force
4 Ir Passage through air
5 Bro Friend
6 Gor Evil
```

And they look as shown below:

```
Ven Ew Kath Ir Bro Gor
-------- -------- -------- -------- -------- --------
***** ** ***** *** ***** *
* * * *** * * * *
* * * * *** * ** * * ******
* * * * * * * * *
***** ** * * * *** ***** *
```

The fourth category invokes the essential character of some
kind of creature in connection to the spell. Their use is
the most esoteric of all the runes, and only advanced wizards
and priest will be able to use them properly.

Their runes in rising order of mana cost are these

```
Number: Name: Meaning:
------- ----- --------
1 Ku Fighter
2 Ros Ninja
3 Dain Wizard
4 Neta Priest
5 Ra God
```

6 Sar Devil

And they look as shown below:

```
Ku Ros Dain Neta Ra Sar
-------- -------- -------- -------- -------- --------
* * ** * * * * * *
* * ** ******* * * * * *
* * * ** * ******* ****
* * * * * * * * * * *
* * ***** * * *** * * * ****
```

That completes this Dungeon Master spell rune description.

I know what you mean, but is that really an original DM disk ?

The original does not have any AUTO folder at all, as it is booted from
a bootsector that loads the other code modules, which are stored as six
files in the root directory, which contains no subfolders at all.

That disk should at *all* times be write protected. Attempting to store
anything on it would quickly fail, as the non-standard diskette format
has very little room in the root directory, and several of the tracks
are intentionally misformatted in various ways, as part of the copy
protection scheme.

After an attempt to write on it, I strongly suspect that the game will
no longer work, as the protection code will probably not consider it
to be a legal original disk anymore.

Exactly the same kind of disk layout is used for the original CSB boot
diskette, but the CSB utility diskette uses a more normal format, as it
contains the character editor, with character portraits that can be added
to by the user. Both these diskettes have boot sectors though, and those
provide the only advisable way to start the programs.

I never have tried to write anything on my own original DM diskette, so
it is possible that you are correct and that it can be done safely,
but I still don't see when and how an AUTO folder would get booted.

That is right of course, with the keyboard removed part of that cooling
air stream would diverge upwards. In my case it is the other way around,
as I have not found a small enough fan to place under the keyboard in such
a position that it can direct the airflow sideways. And for a vertical
airflow (which is what I use) the keyboard must be removed.

How it is mounted does not matter, some vibrations are inevitable anyway,
not least due to your typing on the keyboard, and harddisk, floppy, etc.

Well then, why don't you contact Centek and demand that they send you a new
CT2B board then, with the FPU socket properly soldered. That is obviously
a fault in the manufacturing process, and if their warranty is of any value
whatever, they should replace your board directly for such a fault.

This is a good opportunity to find out how serious they are about this
warranty. You are entitled to have a correctly assembled CT2B board,
so if they refuse you that then their warranty is no good.

>>other chips, or near the memory board.

This post by Mikey shows that Centek consider the DMA connection to be
a 'high-risk' factor. It even indicates that they are unsure of whether
their current ispLSI logic does the job well enough.

>Also, I did leave all the CT2B cable connections long on purpose.
>So that DMA wire may be the trouble.

I am fairly certain that it is involved, though other things can be too.
The stuff mentioned above is one reason, but there is another one too.

The DMA connection involves a 'pulldown' resistor of 68 Ohms, connected
directly to ground. Now that is one hell of a big load for any normal
logic driver, so I attempted to change it. I used normal methods to
raise the DC load resistance without affecting the HF impedance, and this
did work mostly, but then I noted erroneous data for CD-ROM reads, and
in the end I had to go back to Centeks solution of a simple 68 Ohm
resistor.

This means that the signal really needs a very heavy purely resistive
load, and any impedance variations (such as caused by cable length)
can be expected to cause errors.

>with a virtual screen of 1280 x 1280. No sidescreen scrolling. Just
>up and down abit. Didn't bother me at all.

I would find it very irritating, but tastes differ. In any case I have
now installed the Videlity (now freeware) driver and reconfigured my
system for this, and am now using 1280x960 in 256 colours as my main
resolution. At this rez ST-RAM access speed is down to 93% of what
it would be on a standard Falcon running 640x400 in one bitplane, so
I think I'll have no problems.

>Also, I could do 800x600 in 256colors and abit higher 9??x7??.
>No problems with screen flicker in any of these modes.

I still don't see the point of most 'screenblasters' etc, as Videl Inside
could provide 960x720 without any new clocks at all, provided that a good
and flexible Multisync monitor was used, and to use higher rez on a Falcon
with safety you must have a real accelerator anyhow.

>I've not done the VGA adapter modification yet. Should I expect
>to get 800x600 in 256colors or TrueColor without the VGA adapter
>modification?

Not in truecolour in any case, even with the mod, except if you have a
multisync monitor that can 'swallow' PAL timing. In 256 colurs you should
be able to get both that resolution and much higher, using the 50 MHz
clock.

Also, like I said previously. What meaning the 32 MHz clock has for you
depends entirely on your monitor, and the range of signal timing that it
will allow and be able to use efficiently. For some monitors the 32 MHz
clock is important, but for others it is not needed at all.

>I'm just wondering about what kind of extended resolutions I will
>miss if this isn't done. The docs don't say.

They can't say that as it depends on the user's monitor.

>I could never use 57600 with STinG before the CT2B.
>
That is because you let Videl block the ST-RAM access to service a 1280x960
display in 16 colours. Of all chips that access ST-RAM, Videl has highest
priority, so it can block all others from access (even SCSI DMA !).

At a lower display rez, like the 960x720 in 16 colours using 75Hz interlace,
I could always use that same serial speed 76800. That was no problem.

Like I have said before, both in posts here and elsewhere: For the user of
an unaccelerated Falcon, the key to efficient use of the system lies in
finding a suitable compromize between display resolution and system speed.

You unfortunately settled for an unsuitable compromize that made highspeed
serial communication impossible. I know many others who have made the same
mistake of forgetting that the nicer resolutions of Videl can handicap the
system. To find out how much, boot in compatibility mode, and run NEMBENCH
with your old resolution active and then inspect the values for ST-RAM access
shown in the NEMBENCH output.

>>Feelings are elusive, and not well quantized.
>>A 'feeling' of 3-4 could mean anything from 2 to 6.
>>The best way to know is to measure it instead, and one
>>of the easiest ways to do that is to use NemBench.
>
>True, I've never put it to the test yet. Will try NemBench soon
>and see what I've got.

That is the best way, but in interpreting the values we should always
remember that the reference value of 100% always refers to a Falcon
running 640x400 in a single bitplane.

This means that very few normal Falcons will ever reach that speed,
as most users work in much higher rez with more bitplanes.

>Yes, NVDI should give more speed.

It does do that as well, but for a CT2B owner NVDI is mainly
important because of its ability to turn off the blitter.
That must be done for the system to work well with FastRAM.

>Well, I've went as far as to try and boot into Tos 7.x but
>didn't have NVDI installed so no blitter control. It would
>do the Ram and Fast Ram testing and etc. But I think it will
>Bomb if NVDI isn't installed to control the Blitter.

When I do the same I usually do reach the desktop, but as soon
as I move the mouse into a menu the system bombs every time,
and the same thing happens if I try to open a drive, or do any
other thing that updates the display.

----- snip ----- re: your SCSI problems and possible causes
>
>It could be the termination. I have the CDR as the last SCSI
>device in the chain. It is not terminated. If I put termination

>on it. The Falcon will not boot the SCSI drives. I noticed this
>before installing the CT2B. I'll go thru all the SCSI devices
>asap and check Termination. I may have to switch some drives around
>to get it right.

Getting this right is valuable even if it doesn't eliminate your
CT2 turbo boot problem.

>>What is the length and type of the cable you use now ?
>
>Not sure what Type it would be, But it is at least 5 feet long.
>Thats not counting the Scsi connecting ribbon cable which is at least
>2 Feet long. I know this probably seems long, But I've never had
>a problem with my SCSI drives with this length of cable.

I have used similar lengths, but length is more critical at higher
speeds. My own ribbon cable is comparable to yours, but the main
SCSI cable leading to it from the Falcon is much shorter, about one
meter, whereas yours is 'at least' one and a half meters. That does
seem a bit long to me. In another post I saw you refer to it as
7 feet, which is appx 2.1 meters, and that is rather long.

>I bought the SCSI cable from Toad Computers for the Falcon.
>But it may be to long for the Turbo modes. It's the only SCSI cable
>I have at the moment.

I see, so no choice then but to use it. I hope you can make it work.

AFAIK, Wdialog can't be charged for this. Most likely the problem is that
he's running a machine with an AES which doesn't support coloricons.
Like most modern programs Mymail requires AES > 3.30.
Install N.AES or Magic and Mymail won't complain anymore.

835. CAB 2.7 Lockup Problem?

Newsgroup: comp.sys.atari.st
Date: 1999-06-19 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7kh31a$2icm@enews4.newsguy.com>
Source record: 77068

```
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
*Using >> Falcon030 (14meg w/Nemesis), NVDI 4.1, MagiC 5.11, STinG 1.20
- - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -

(Strange problem with CAB 2.7)

This only seems to happen the FIRST time I run CAB 2.7 after booting the
computer (ie. the computer has been turned OFF for several hours prior to
booting it):

Ok, I boot the Falcon, connect to my ISP with STinG, load CAB, then no matter
what page I try to access, CAB will freeze up during the first 10-20 seconds of
loading the page (and this happens regardless of whether I delete CAB's cache
first). And unfortunately, it COMPLETELY freezes up the Falcon, I can't even
access the Program Manager to terminate CAB manually, nor shutdown. I have to
reboot with a reset.

And after this, if I reload CAB and try again, I never have a problem. It
works fine the whole session.

And in case anyone is wondering, it doesn't seem to matter how long the Falcon
has been turned on. I could have had it on for 5 minutes or 4 hours, but if
this is the first time I run CAB and try to load a page in that particular
session, it will freeze up.

I've been able to get it to work ok maybe 50% of the time by attempting to load
a page in CAB, but quickly "STOPPING" the load, quiting CAB, then reloading
CAB, then continuing loading that page. This is a bit clumsy, but is faster
than a complete reboot. :^|

I'm not certain, but I think this problem started right around the time I had
the Nemesis installed, and right around the time I upgraded to STinG 1.20 as
well. However, I have not done any testing with the old version of STinG or
without Nemesis yet, but I will the next time I start up the Falcon.

Any ideas or suggestions?
Anyone else experience this?

836. POPwatch Timeout Problem

Newsgroup: comp.sys.atari.st
Date: 1999-06-19 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7kh31d$2icm@enews4.newsguy.com>
Source record: 77069

- -
*Using >> Falcon030 (14meg w/Nemesis), NVDI 4.1, MagiC 5.11, STinG 1.20
- -

I've been using POPwatch 2.91 for a long time now, but lately, when I simply try to CONNECT (or send Queued mail that was written with NEWSie), I get an immediate "-00015 user timeout expired" message - BEFORE I EVEN CONNECT! And sometimes when I'm downloading a few e-mails, midway through I get this same error message. At one point I thought I had solved the problem by deleting the "History" file, and turning off all logging. But the problem reappeared some time later.

And it had worked perfectly for months, and I've not changed any settings. My "CONNECT TIMEOUT" is at 60 seconds, and my "DATA TIMEOUT" is at 100 seconds.

I've reinstalled the program a couple times from backup, and now recently grabbed the archive from Gary's web site again to re-install it that way. Same problem though.

Often it will work fine for days, then all of a sudden it's "TIMEOUT city"!

The only thing I think is different on my system recently is an upgrade to STinG 1.20 from 1.15, and the fact that I now have a NEMESIS installed in my Falcon. And perhaps this problem is somehow related to the strange freeze up problems I've been having with CAB 2.7?

Any suggestions?

I thought that the Hardware versions helped give the video system
a boost to obtain higher resolutions without slowing down everything
else.
All I know is that I found it very useful. Have you ever tried
ScreenBlaster II?

From my experience Falcons can be different. I could never get a
working 57600 port speed connection with STinG. Even at 640X480 in
16 colors. Never tried 320x200 16colors or Monochrome as those
resolutions are not acceptable for me.
1280x960 with ScreenBlaster was actually a bit faster than
no ScreenBlaster in 640x480 16colors. In both cases 38400 was the
highest working port speed.

Not now however, 230400 Works Great and is very Fast.
But we are talking about port speeds here not actual modem to modem
speeds. ;)

Personally I like SpeedoGDos, and would rather have a patch or
program that will control the Blitter than to have to install
NVDI just for Blitter Control.

Yes, thats exactly what I experience.
Just a simple program to control the blitter at all times?

>
>Getting this right is valuable even if it doesn't eliminate your

I suppose so, but at the time it worked great as it is set now.
So, I didn't bother trying to fix something that worked.

But, now I'll have to check into that. I'll probably
start with the CT2B wire and make sure its short and not
over a chip and etc.
>
>

>

That 7 feet was a mistake on my part. It is approximately 5 feet
in length. I can work with a shorter SCSI cable if needed.
But before I buy another one I'll try looking at the DMA wire and
etc, first.
>

BTW, did you get some type of small patch board with your CT2B?
I thought I saw a posting from you about that?
There is no mention of a small patch board in my docs. I certainly
did not receive one and if I should have then I want it.

Thanks,

Hi!

TG>Hahahahahahahahahahahahahahaahahahahahahahahahahahaaha!

Oh, come on Tony. Not again, please!

It's not our intention to see games that have n*n big sprites with four layer parallax scrolling etc. (but who knows what's possible.:-) I never thought that demo effects like in GEM Demo can run in a window at such a high speed!) But I won't reset MagiC, boot up TOS and switch to low res to relax from some e.g. word processing and then 5 minutes later switch back to the MagiC setup, fire up papyrus to continue my work. Or big downloads are the ideal time for a relaxing round of e.g. Missile Comand, ... :-)

And even if those people are a big minority in your eyes. Atarians with gfx cards and clones would probably appreciate those little fun games too.:-)

TG>Great stuff!...Can't wait hehehehe to see these!

Yeah! :-) Just wait and see!

Ok, this will be my only post. I think my point is clear and I hope this discussion won't grow as big as other famous TG discussions did.

Regards,
Jan

On 19 Jun 1999 18:48:24 , Ronald Andersson wrote:

->I know what you mean, but is that really an original DM disk ?

Yes, it is. ;-)

->The original does not have any AUTO folder at all, as it is booted from
->a bootsector that loads the other code modules, which are stored as six
->files in the root directory, which contains no subfolders at all.

Thats right. I created an auto folder there, then added the cache
program. Note that on machines with expanded memory, DM is supposed
to create its own cache (ram disk, I assume) and access data from
there, saving disk access...

->That disk should at *all* times be write protected. Attempting to store
->anything on it would quickly fail, as the non-standard diskette format
->has very little room in the root directory, and several of the tracks
->are intentionally misformatted in various ways, as part of the copy
->protection scheme.

Anytime you alter an original commercial (copy-protected) disk, you
are taking a chance. It should always be assumed, "do this at your
own risk!" <grin> In some cases though, definite advantages are truly
gained. Take Ultima 5 for example-3 floppy disks-won't install on a
HD, and won't access a 2nd floppy. A disk-cache in the AUTO folder
here, makes all the difference in the world in game play. ;-)

->After an attempt to write on it, I strongly suspect that the game will
->no longer work, as the protection code will probably not consider it
->to be a legal original disk anymore.

I can not testify to anyone elses experiences but my own. However, on
my 1st (original) DM disk, it did work fine. I've not tried it since
then, because I no longer have any 512k machines. The least I have is
4 megs...

->Exactly the same kind of disk layout is used for the original CSB boot
->diskette, but the CSB utility diskette uses a more normal format, as it
->contains the character editor, with character portraits that can be added
->to by the user. Both these diskettes have boot sectors though, and those
->provide the only advisable way to start the programs.

I never tried it with CSB, because it uses extra memory, and it also
uses a 2nd floppy drive if you have it. Much nicer! ;-)

->I never have tried to write anything on my own original DM diskette, so
->it is possible that you are correct and that it can be done safely,

->but I still don't see when and how an AUTO folder would get booted.

See ya later! ;-)

There are many CAB.OVL files around.

>I set RAM to 0, CACHE to 0, left images on as a trial.

You must have misunderstood me.
I told you to set RAM CACHE to zero, not RAM *and* disk CACHE.
Given the way CAB and CAB.OVL interact I doubt that CAB can work
correctly with no disk cache at all. Naturally you can't have a
very large disk cache on floppy, but you can have enough for some
simple text browsing, and clean that cache out regularly after you
are finished with a site

>CAB 1.5 connected and images worked fine for first 3 pages then lockup.
>
> Turning images off and saving changes, I went online again and selected

>appear in the info line at the top of the screen and disk access is
>constant. After 10 minutes, the disk drive is still running. I had to
>cut the power to stop it.

I think this means CAB is trying to use the disk cache while also trying
to keep its size below the zero value you set up above. That can't work
of course.

>as the one centek use.

German: English: Swedish:
------- -------- --------
Lager Bearing(s) Lager
Kugellager Ball bearing(s) Kullager

As you can see, swedes (and other nordics) will understand the german words
here, being so similar to our own, but english speakers will probably need
their own words to be used to have a chance at getting it.

Oh dear, Centek has switched revisions on us without telling then...!!!

At least for the installation method, though I guess the main CT2 board
is identical. (I certainly hope it is, or we're 'gropin in the darkness'.)

The CT2B kit I received did contain a small extra board, and the mounting
of it is clearly described both in the 8 page (A5 format) manual, as well
as in the corresponding files on the diskette supplied in the same kit.

>You do have to solder some wires to the empty sockets of U62 and
>U63. But there is no small board that I know of with the CT2B.
>Please Explain.

It is possible that your loose wiring matches exactly the rearrangement
of signals done by the 'MODUL' board supplied to others (like me). One
reason for this change may be that the board caused some risk of short
circuits by contact with the top shield plate when that is reinstalled,
which is why I earlier described some precautions to take against that.

Does *anyone* have a Syquest removable drive hooked to their ST?? I just came into a couple that have 44 meg removables and one 200 meg removables. The 44's work fine, but I'm having trouble with the 200.
I hooked it to my hard drive with a SCSI cable... the ID was fine and it was seen on bootup. My hard drive is a 105 meg partitioned as drives C, D, E and F. I installed a drive G - hoping it would show the Syquest - but when I clicked on it it said "drive not found".
I put in my ICD disk thinking I needed to format the thing, then read the docs that I might format the WRONG drive... I certainly don't want to reformat my hard drive by mistake!
Can someone H-E-L-P???

Hummm...I believed that we Atari or TOS users were a lot more openminded than most other users!
Are we taking the same response as PC (dos,windows) users when we are mentioned anyother computer
than Atari? I invested lots of money on Atari as the machines I got I got them new. My question is , where is the Atari company anyway and how well did they supported us anyway? Is this becoming some kind of fanatic situation? I use my computer for work and when the work needs to be done I got to do it on any machine that would do the job.
Sometimes you get a new device and there is no Atari program that supports it and exmaple of that is the CDR I just got. So, Emulators are very good tools to have around specially in times when you may not have your Atari around for whatever reason. My Falcon is broken now and emulators enhable me to continue my work.
Can we aford to scare away talented programmers, that same Emulator creator may bring a very fine TOS prg in the future!
Can we aford to scare away Atari users just because they also enjoy using other computers?
Is any Linux user upset because we use MINTOS (unix like) on Atari?
Is any Mac user upset because we use Mac emulation on Atari?

Please think about this and you may figure what is more positive for all ToS users.
Raymond

865. STf joystick???

Newsgroup: comp.sys.atari.st
Date: 1999-06-20 00:00:00 UTC
From: lethor7@aol.com
Message-ID: <19990620002931.17200.00001463@ng-cs1.aol.com>
Source record: 77077

hi,
3 questions to ask

1. Where can I buy an reasonably priced simple joystick for games
like Rainbow Islands and etc?

2. Can I use old Atari joysticks from older Atari consoles?

3. Why doesn't the ST allow the use of the keypad for
such games???

thanks,
jim.

Could you please be more specific why that would be a problem? AES
hooks into the trap as well, and as AES does not use XBRA, the
information wouldn't be accessible anyway.

The 3.* versions of AMCGDOS are free downloads, but certainly NOT
public domain. In particular, it is not allowed to modify it without
the agreement of the author.

It certainly is a good idea to have it in a known place. So we should
try to find the latest version and place it somewhere. However I don't
agree that it needs to be modified to be useful.

> It could very well be Wdialog, i remember when i was trying Stewart it
wouldn�t

Greetings all,

I believe Martin is right here. The DOC's for myMAIL says that a newer
AES is required. Though, after asking the same question as you do I got
told by (I believe it was Erik H�ll) that a newer AES is *preferred*,
but not absolutely necessary. Most of the functionality will still be
there, even if some of the icons won�t be able to view properly.

In that case it would be a matter of editing the RSC-file to make things
look OK.

The check for newer AES must be hard-coded into MyMAIL.

Regards,

Joakim

That's odd, Steve. It's fine on my Falcon under MagiC/MagXdesk. Perhaps it doesn't like Jinnee?

Since when did you get Jinnee, btw? At the last Cheshunt meeting, I'm sure you still had MagXdesk??

First word:
CAB, equal witch release, runs fine on any atari hardware.
I tested by my self: 520ST 4Meg, Nemesised Falcon, CT2 Falcon.
All modes, or on naked hardware.

> Ok, I boot the Falcon, connect to my ISP with STinG, load CAB, then no matter

CAB must have access to his cache well, anytime. All pathes true?
Othersides, your problem sounds like CAB.OVL doasnï¿½t connected to STinG.
(The point of CAB freeze the machine)

> And after this, if I reload CAB and try again, I never have a problem. It
> works fine the whole session.

I donï¿½t know what it is. Canï¿½t see your installation :)
Do you use an http proxy?
Try to delete this setting.

Reboot the machine, remove all other things. Try again only with StinG,
CAB and all what you need for web access.

> And in case anyone is wondering, it doesn't seem to matter how long the Falcon
> has been turned on. I could have had it on for 5 minutes or 4 hours, but if
> this is the first time I run CAB and try to load a page in that particular
> session, it will freeze up.

How is CAB cache? External SCSI device?
Thatï¿½s ok and must bee work in the same way as internal IDE.
If not, do you have DMA/SCSI trouble?

Also with other software on external SCSI?

> I've been able to get it to work ok maybe 50% of the time by attempting to loa
> a page in CAB, but quickly "STOPPING" the load, quiting CAB, then reloading
> CAB, then continuing loading that page. This is a bit clumsy, but is faster
> than a complete reboot. :^|

Thatï¿½s not normal.
Using CAB here since the first release, sure, early releases are a bit
buggy.. But the rest works perfektly, use it with STinG 1.20 OR
iConnect, both versions does exactly the same on a ISDN phone port.
7500cps anytime, no stocks, no interrupts.
Speed various from 1500->7500cps

> I'm not certain, but I think this problem started right around the time I had
> the Nemesis installed, and right around the time I upgraded to STinG 1.20 as
> well. However, I have not done any testing with the old version of STinG or
> without Nemesis yet, but I will the next time I start up the Falcon.
>
> Any ideas or suggestions?
> Anyone else experience this?

Try in low mode, try again with nemesis OFF
With nemesis OFF you must have a simple Falcons, same as without
nemesis. If the problem also appears, have a look to your software
installation. (I think thatï¿½s it)

CAB is nearly perfekt for the falcon. Picture loading a mess.. :/
Also you got only one picture after another, thatï¿½s to slow.
Any other browser takes a lot of information at the same time.
Saves money..

Phone is fucking expensiv in germany.. ;/

> a small board. My CT2B did not come with a small board.
> There is no mention of a small board or Patch board in the docs.

All installations i have seen contains a smal board how was stuck into
the sockets of two pal chips (busemulation), directly in front of the
ct2 board and the resistors R216, R221..

> You do have to solder some wires to the empty sockets of U62 and
> U63. But there is no small board that I know of with the CT2B.
> Please Explain.

Hm, so you must have hardware i never seeï¿½n before.. New Board! :)

> Also, I can use a port speed of 230400 with STinG!!
> That is Fast! Not bad at all.

Yes, thatï¿½s realy fast, i know :)

> As soon as I can, I will look at the SCSI problem I am having.
> I just haven't had time yet to do or check anything about it
> yet. I'll post something about the SCSI problem asap.

Yep, rechek it if you have the time. I try to help you.

> Also, can I use the ScreenBlaster II hardware in TurboModes without
> the VGA Adapter Modification if you know?

Yes, if you switch of "external clock" in setup menu. That works.
Itï¿½s only a idea, saves the "long" screenblaster plug backside.

> I'm still not clear if I need to do the VGA adapter modification
> to get higher resolutions such as 800x600 in 256 colors or TrueColor
> without using ScreenBlaster II.

Hm, i try to find the right words in english..

You MUST have this adaptor if you like to use the internal, ct2 clock
for the videl chip, i you doasnï¿½t use this ct2 clock, you still use the
screenblaster as before. The only one what this adapter does:
videl
(19 monitor connector) (pin 14)
-> external SB clock to videl chip ---- / VGA adaptor --+----##
-> internal ct2 clock for videl -------------------------+ ##

Centek VGA adaptor doas not more as a breaker, supresses only the
external clock source. You only can use ONE clock source.

In setup menue "external clock" you switch ON or OFF clock track from
the ct2 board, so the ct2 is wired to pin 14 of videl chip.

If you use the screenblaster (external) he delivers his clock signal via
pin 19 (monitorport) also to pin 14 of the videl chip, if the ct2 board
does the same in the same time ("external clock OFF") you got two clock
signals in the same time on pin 14 of videl. That canï¿½t work well.
Display trouble follows.

And more..

If you use the external FALCON to VGA original Atari Adaptor..
Pin 19 of this bloody thing is internal connected to GND.

If you doasnï¿½t use the centek adaptor (modification), the clock signal
from ct2, wired to videl chip pin 14, is also connected to GND at the
same time. That canï¿½t work too.

Puh, hard working in another language :)
Hope you understand the technical.

Regards, Robert

> Is that GDOS still covered by commercial copyright, or has it been moved
> into Public Domain ? Does anyone else know this ?

According to swedish law the program is covered by copyright if it is
copyrighted, unless the holder has set it free. However, if you make
alterations, like patching, the program counts as a separate work!
Which means you can copyright it yourself and do whatever you want with it.
Any proceeds from sales of such a reworked

If your homepage server is physically situated in Sweden it has to abide
swedish law. And swedish law only. So even if this swedish perspective is
unlawful or unethical in other countries it's perfectly legal as long as
you're on a server in Sweden. The law stretches to the borders of each
country.

There is an interesting copyright feud about Mein Kampf (Hitler's book)
which was printed in Sweden, but supressed by the Free State of Bavaria,
which claims to be the copyright owner. The swedish publisher claims that
FSB cannot just assume copyright over someone else's work and that by the
author's death the copyright belongs to no one, since AH has no heirs.

The whole matter is further complicated by Mein Kampf's being a politically
very sensitive publication. Which GDOS isn't...

No new hardware, just alternative ways of connecting to the sockets.
One way is by simply soldering wires directly to the sockets, the other is
to press in a small board into some of the sockets.

The direct soldering method is better, specially if Centek has removed your
old CPU. Your ships are torched, no way back, stay and fight.

Hmmm..thats interesting. I wonder what the differences are between
the CT2B with the patch board and the ones without the patch board?

Where the CT2s with the patch board labled as a B version?

The chips at U62 and U63 have to be removed. Then you solder some
wires from the CT2B to them and also add some jumpers.
Also the socketed chips U67 and U68 are removed,
but nothing is done to those after removing.
Can you tell me what U62, U63, U67 and U68 are for on a stock Falcon?

Also what does the CT2B modification of U62 and U63 do exactly?
U67 and U68 have no modification, but they have to be removed.

Anything you can tell me about the Patch board would help me
understand what all this is for.

>
>Yep, rechek it if you have the time. I try to help you.

ok, I had some time last night to look at the SCSI problem.
I shortened the DMA wire as much as possible. This did not
solve the problem.
Also, I went thru all 4 SCSI drives. I disconnected the First
SCSI drive from the cable and tried it with the 540meg SCSI,
the CDRom and the CDR. This also did not help. Got the exact
same results. I also disconnected all SCSI drives except for the
CDR and I did get it to boot once.

Also, I disconnected the CDR and the CDRom and tried it with
just the SeaGate 1gig and Or just the Conner 540meg SCSI.
This also did not help.

Also, I tried messing around with the Termination on the last
and first SCSI drive in the Chain. This also did not help.

I find it hard to believe that all my SCSI drives are not
compatible. So it may be the length of my SCSI main cable.

Now I have all drives back in the original setup which works
fine in standard Falcon Mode.

Is there any other modification that is done with the CT2B that
would cause the SCSI drives not boot/work in Turbo modes?

The resistors at R221 and R222 have to be removed and these
were already removed because I had a Nemesis buffer installed.
I removed the Nemesis buffer. Also with the Nemesis buffer
modification I had to remove R216. With the CT2B the docs says
to add a resistor at R216 and one comes with the CT2B. I did
solder this resistor at R216. The docs say without this resistor
the CT2B may not work correctly.

Do any of these resistors have anything to do with the SCSI in
Turbo Modes?

About the only thing I know to do now is to get a shorter SCSI
main cable. Unless there is some other modification that effects
the SCSI in Turbo Modes that I can look at.

Also, I don't have the latest version of HD Driver. Could that
have anything to do with it?

I'll have to check my settings in HD Driver and make sure they
are correct. What SCSI ID number should the Falcon be? I think
the CT2B software sees the Falcon as a ID of 7.

Also should I have SCSI bus Arbitration set on in HD Driver?

Is there any settings in the CT2B configuration setup that would
affect the working of the SCSI in Turbo Modes?

From what I am seeing it is almost like the SCSI drives are being
accessed to Fast and the information is getting scrambled, when I
try to use them in Turbo Modes. But not sure if this is correct or
not. I know that in normal Falcon mode when booting, the slowest part
is when HD Driver accesses the SCSI drives. It takes awhile before
they are recognized. This also may mean the my main SCSI cable is
too long.

Also, the last time I installed the Flash update, I was in normal
Falcon mode, But not sure if I had the SCSI drives connected or not.
If I had the SCSI cable off and installed the Flash. Would this
cause a problem when trying to use the SCSI in Turbo Modes?

>Puh, hard working in another language :)
>Hope you understand the technical.

Thanks for all that information on ScreenBlaster II and the VGA
adapter modification. This has cleared up alot of my questions.
And I'll now know which way I'll want to go with it.

Also, I tried Apex version 2.41 and I can now use it in 640 x 400/480?
TrueColor mode in CT2B TurboMode! That is very nice!
Apex version 2.00 will work in Turbo Mode, but not in 640x400/480?
TrueColor mode.
I've got to put the Expose on the bottom and the CT2B on the Top Soon!
;)

You don't need GEMulator or MagiPC with the latest Calamus 99 (when it becomes available in English - soon?). Order the Windows compatible mode and the package includes its own version of GEMulator or Magic or whatever the shell is that allows Calamus to run under Windows and use Windows printer drivers.

And you don't need to. I am *very* aware of it, being the one who
documented and published it first (based on previous proposals of Moshe
Braner which lacked the famout XBRA string).

I am not aware of any program which would need to do this. The GEM trap
historically never was XBRA friendly, and if a program which hooks into
this trap needs to find out about other's, it should use the cookies
that they install.

> For such a case the fact that TOS will break the chain towards the

Actually you can inquire which version of GDOS is installed by calling
trap #2 with a special opcode.

How about finally giving a real world example? Which auto folder
program requires that the GDOS in use is using XBRA to change the GEM
trap????

It's a 4 meg upgrade by Frontier/Marpet called Xtra RAM upgrade, not the
'deluxe one'. It requires, like all those I've come across, to have the
memory on the STFM motherboard to be by-passed/disabled.

This should be a common thing to do no matter what upgrade you use as
it's disabling the memory the ST's side of the matter and NOT the
upgrade.

> Can someone H-E-L-P???

Hi

Have you tried an ID check, to make sure that ICD is detecting the
drive?

If the drives detected, then try reformatting the device, not your fixed
105 drive.

Unless the drive is already formatted/partitioned in a format that the
Atari can read, it won't be accessible or assigned a drive letter.

I've been using a EZ135 for ages now and have had no problems at all,
with ICD or Hddriver!

If I've missed something, I dear say someone will mention it;)

Cheers,
Steve

887. vfat and STZIP v2.6

Newsgroup: comp.sys.atari.st
Date: 1999-06-21 00:00:00 UTC
From: roger.carr@zetnet.co.uk
Message-ID: <376e77e0$0$1786@znews.zetnet.co.uk>
Source record: 76899

Does anyone know a vfat-friendly version of STZIP?

Using STZIP.PRG v2.6, I tried unsuccessfully to unzip a number of files in a folder which had the 'blank' character in the first eight letters of its zipped long-filename.

All I ended up with was the empty folder, with its name truncated at the blank. I was then returned to STZIP's main screen with no error message.

I ran the Check procedure from the main screen, which reported all files present with no inflation errors.

Any comments, please?

Roger Carr

Roger,

I don't think there's a better one, since 2.6 was to my knowledge the last
one from Vincent... he quit development.

It might help to "shorten" the name, omitting blanks or even to a 8+3 name.

My experience with Graftool's the same, any blank in a filename and it
won't load. Cut the blank out and it's loaded OK... Then, Graftool will
load LFN's OK, where I'm not sure about ST_ZIP.

Hi Roger,

I had a similar problem with some Zip files I got from the EIL99 download
site.
It turned out that the number of characters in the folder names were what
was causing the problem, and I was advised to use the unix port of Zip to
extract the files. (See Readme file from this utility below for more info.)
This worked fine for me, but. unfortunately, I cannot remember where I
found it......
If you want, I can mail it to you.

Best Wishes,

Jim.

>(See Readme file from this utility below for more info.)

Oops ! I forgot to include it.....

```
-----------------------------------------
This is a ATARI port of zip2.0 and unzip5.13

The main new features are support of long-filenames
and symbolic links (with MINIX-FS) and full UNIX-wildcards (not only
DOS-wildcards) as command-line arguments.

It's still a beta-release, so be careful when using it.
It contains only zip.ttp and unzip.ttp and some doc-files.
The other ones (funzip.ttp, zipsplit.ttp, zipcloak.ttp, unzipsfx.ttp,...)
will be included in the next release.

I used gcc 2.5.8 and Mintlibs PL46 for compiling and linking.
If you have any questions, feel free to contact me at
<harry@hal.westfalen.de> or <hd@ms.maus.de>

regards,
Harald
-----------------------------------------
```

Sorry about that !

Jim.

896. STf <--> CAB!

Newsgroup: comp.sys.atari.st
Date: 1999-06-21 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.990621191819.9999C-100000@halifax.chebucto.ns.ca>
Source record: 76908

Hi Ronlad,

I finally have it working well.

I refresh CAB immediately before proceeding with the first offsite URL
by freeing the disk cache and then doing it every 5 sites I visit.

I also created a fresh new disk and put the files there as I think I
may have trashed the first one by powering down when it was locked up.

I plan on doing demos for our club members this fall at upcoming
meetings. I will do a Falcon and STf demo to illustrate the setups for
both so that anyone with an ST, regardless of the power and the ram, can
access the local PPP service.

Thanks for all your help.

Tony

You can't use the Spectrum +2 type joysticks as, although they use the
same connectors, the wiring is different.

Maybe there should be some limits put on the programming language used for
this? How about only asm, c, modula, and pascal?

This way we don't get boring 320x200 lowrez games that have to
be patched for every known TOS version. :-)

...
>I think they just didn't want to have to implement a proper 'software'
>blitter, so they just skipped it, keeping their patches to the bare

The AB040 patches actually do not implement a software blit. Instead it
copies the data to ST-RAM and then lets the blitter do it's job from
the new address.
Somewhat surprisingly, this seems to work rather well.

>>As Ronald said in that other thread, it looks like the blitter simply
>>doesn't work at 25MHz, though, so such patching might not help.
>
>I'm not sure why you say the chip runs at 25MHz here, unless it is the

I'm pretty sure the blitter is running at 25MHz. My Falcon docs seem
to have disappeared (I think I lent them to someone a year or two ago...),
though, so I can't check it.
The old Mega/STE blitter certainly ran at 8MHz and I _really_ think the
Falcon just doubled that.

>old habit of halveing the Videl frequency. I consider it incorrect
>though, as the physical clock signal is 50MHz, just as it is 32 MHz

But physical clock signals are really rather irrelevant without further
information. They get divided and multiplied all over the place and
for busses it's much worse than that (bus width, multi-clock protocols,
handshaking, double edge triggering).

>>For now, only the monochrome and 16 colour drivers are really usable,
>>but there is a 16 bit one as well. For 256 colours you'd have to
>>write your own, or convince someone else that it's needed.
>
>Is there a particular problem with 256 colour mode ?

Not apart from a chronical lack of time on my part.
(8 bit is also more of a pain to program for since you easily run
out of registers.)

Earlier I almost never used any graphics modes besides 1008x608x4bit
and 1024x768x1bit, so naturally most of my device driver development
was focused on creating good ones for monochrome and 16 colour modes.
Nowadays I use 1024x768x16bit on my Eclipse/RageII instead, and guess
what driver I work on then? ;-)

>I'd say just about every Falcon user would find it 'needed'.

I certainly didn't, and if others do they should contact me.

NVDI (which isn't at all bad at most things) was just too painfully
slow in Falcon 8 bit mode, and in 16 bit there were no usable resolutions.

>Even now, with my CT2, it is inevitably the bitplane mode I will use
>for my main work resolution, as the 16 bit mode will not work in the

If you want reasonable graphics in windows, I guess 16 colours are
stretching the limits, even at high resolution. That's one of the
reasons why it took me so long to get around to implementing windowed
image display in MGIF (it's coming now (once I find some time), though).

>My new work resolution, achieved by Videlity, is 1280x960x8bit at 61 Hz,
>displayed on my (recently repaired) 19inch multisync monitor.

Well, while you're waiting for the Eclipse to be released (should be
any week now), perhaps you could write an eight bitplane fVDI driver? ;-)

900. Videlity Vs. LGE 520Si - fixed at last!

Newsgroup: comp.sys.atari.st
Date: 1999-06-21 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <376eeec8@nemo.idirect.com>
Source record: 76912

okay, about a month ago I was asking for help from people here regarding the problems I was having with my new LG Electronics 520Si 15" monitor and Videlity, and how when trying to use it in Hi Res TrueColour it would actually activate EnergyStar and shut the screen down!

well, I'm happy to say that the problem has been solved - turns out that I had the original release of Videlity. The currect version (1.03, which has now been released as freeware) has fixed the problem, and I can now go back to using a 736x560 TC screen. CAB 2.7 looks stunning on this monitor in this mode :)

Thanks to everyone here who gave all the possible suggestions to fix it, including Dave Encill at Core, Edward Baiz and Derryck Croker.

BTW, every Falcon owner really should give Videlity a try, it's perhaps the best no-brainer video enhancement software out there.

Source record: 76966

Hi Ronald,

STinG connects fine, starting CAB works well until I enter the first url for the Internet. When I first start CAB, it loads a special small html file I have on the A:\ drive disk which is fine. So far so good - I'm am successfully online with PPP on a 1040 STf and CAB is running.

Entering the first url:

http://www.chebucto.ns.ca/ (our freenet homepage)

with the images turned off, the page loaded is only 1400 bytes total. I had set the disk ram, per your instructions, at 1 mb (the smallest setting there is, unfortunately - any way around this limitation) and saved the settings. I get the same result as before.

The page loads and the words "Formatting text..." appear in the url header and the A:\ drive starts running with a 'chip-chip, chip-chip' sound as if it were looking for something.

I'm stuck at this point but I am so close.

Any ideas?

It should work. The Atari joystick port was the standard in those days, which means you can use a joystick from any Sinclair, Amstrad, C64, Amiga, etc...

> 3. Why doesn't the ST allow the use of the keypad for
> such games???

Because the designers of TOS probably didn't figure it would be worth adding it to the system. The machine wasn't intended to be 100% games machine anyway.

Some games do allow it, because the programmers included it in their code.

You need an Atari monitor, either monochrome or colour, depending on
what you want to use the machine for.

You can connect an STFM to a TV instead of using a colour screen.

If you really have no other option, you can use a VGA as a monochrome
monitor, but this means getting out the soldering iron and building an
adapter. There are instruction in the Quick FAQ.

Ok, the first question to ask is, what are you planning on doing with
it?

You must be aware that when people say that an Atari is great for music,
this means MIDI sequencing, definitely not for Audio or sound processing
unless you go for a Falcon. I was discussing with someone recently who
was very disappointed because he had bought an ST thinking it would

replace synth or a sound module. In a MIDI setup, an Atari does not make a sound!

Now, if you are into MIDI, then make sure you buy a complete setup, with a pro software package such as Cubase or Notator. This will probably make the whole thing more expensive, but it is getting really difficult to buy the software separately nowadays.

For just MIDI, a 1Mb 1040STE with a mono monitor and Cubase, and no HD, is just about all you need. If you want scoring capabilities, then a bit more RAM will be required, say an STE maxxed out at 4Mb. Avoid the STF machines, as they are more difficult to upgrade. You should be able to get a setup like this for 200 to 400 USD.

Well, the 50MHz pixel clock you get with something like the hardware
version of BlowUP is a lot higher than the normal 32MHz.
That means you'll get a lot less flicker at the same resolutions.

>and flexible Multisync monitor was used, and to use higher rez on a Falcon
>with safety you must have a real accelerator anyhow.

The resolution in itself is no problem for the Falcon, but if you're
using an 8 or 16 bit mode things can of course slow down a lot.
I never had any problems whatsoever on my unaccelerated Falcon using
1008x608x4bit (at something like 55-60Hz, IIRC).

>>Yes, NVDI should give more speed.
>
>It does do that as well, but for a CT2B owner NVDI is mainly
>important because of its ability to turn off the blitter.
>That must be done for the system to work well with FastRAM.

As was said in another thread recently, you can get around that by
patching things a bit. This was done in the AB040 Toolkit, but
apparently Centek seems it's a good idea to force people to buy NVDI
(but see below).

As Ronald said in that other thread, it looks like the blitter simply
doesn't work at 25MHz, though, so such patching might not help.

>>Well, I've went as far as to try and boot into Tos 7.x but
>>didn't have NVDI installed so no blitter control. It would
>>do the Ram and Fast Ram testing and etc. But I think it will
>>Bomb if NVDI isn't installed to control the Blitter.

If you don't have NVDI, why not give fVDI a try?
It will solve your blitter problem and doesn't cost anything.

For now, only the monochrome and 16 colour drivers are really usable,
but there is a 16 bit one as well. For 256 colours you'd have to

write your own, or convince someone else that it's needed.

That's not it. They only make the higher resolutions possible.
Things will slow down even more.

If you have problems in the normal 640x480, then it's not the
fault of the graphics mode.

>Just a simple program to control the blitter at all times?

Such a program would have to replace most of the VDI, since the
'turn off blitter' function really only tells the VDI not to use it.

As I said in my other message in this thread, try fVDI.
I haven't tried it together with SpeedoGDOS, but if it doesn't work
I'll try to fix that.

Hi Paul,

----- snip ----- re: strange problems with Popwatch and CAB

I've been trying to think of what possible common factor those two clients could have, but I can't think of anything that they would share that would not also affect all other clients. Are these two the only ones you use ?

Several factors are common to both:

1: Basic STinG configuration, mainly through DEFAULT.CFG, the CPXs, and through the DIAL.SCR . You may need to check these for any mistakes made or settings forgotten in switching to STinG 1.20 .

2: DNS operations, which depend on a legal NAMESERVER, either from the DEFAULT.CFG or from DIAL.SCR, or even through PPP login directly from your ISP. Check settings against your account info.

3: DNS cache file. A corrupt one can have strange effects, and the best cure then is simply to erase CACHE.DNS and reboot. That will cause a message about the file being missing when STinG boots RESOLVE.STX, but a new CACHE.DNS will be created automatically.

>All I know is that I found it very useful. Have you ever tried
>ScreenBlaster II?

No, I haven't used any hardware to boost resolution alone. I never saw the
point in it, as I have had access to decent resolutions anyhow through VI2.
Recently I switched to Videlity though (now freeware), and it does seem to
have all the capabilities that VI2 had, although organized differently.

I suppose some of the hardware for resolution boosters may actually be some
limited kind of accelerator, boosting the Videl+Combel clocking, but I still
never used any of them, so that's just a guess.

>From my experience Falcons can be different. I could never get a
>working 57600 port speed connection with STinG. Even at 640X480 in
>16 colors.

That sounds very odd to me. I never had such problems. At very high
resolutions I naturally had to use low baudrates, but not in 'TT-high'.

>Never tried 320x200 16colors or Monochrome as those
>resolutions are not acceptable for me.

ST-Low should never be necessary just to get a decent baudrate.
If that is the case then the system is very very sick...

>1280x960 with ScreenBlaster was actually a bit faster than
>no ScreenBlaster in 640x480 16colors. In both cases 38400 was the
>highest working port speed.

A screen blaster may be able to increase system speed slightly, by
increasing the Combel+Videl clocking, but they certainly can't multiply
that clock by 4 (to 128 MHz!!!) which is what your example implies.
Something is very wrong in this comparison. I strongly suspect that
the higher rez used interlace, as opposed to the lower one, and that

further differencies in scanrates also existed.

The mystery here is not that your system worked as it did in the higher
rez however, but rather why it worked so horribly bad at lower rez.
With proper use of interlace and multisync resolution timing I have
been able to use 960x720 without experiencing any problems with serial
rates of 76800 BPS. I avoided higher rez to avoid serial problems.
Now (of course) the CT2 has removed that limitation as well.

>Not now however, 230400 Works Great and is very Fast.
>But we are talking about port speeds here not actual modem to modem
>speeds. ;)

Of course. AFAIK 56K is still the fastest modulation speed for ordinary
telephone networks. ISDN is a bit faster of course (dual 64K BPS lines),
but it is still a bit too expensive for me. But the higher rates can be
used partly to make modem compression efficient, and partly for higher
speeds on local networks.

>>It does do that as well, but for a CT2B owner NVDI is mainly

>>That must be done for the system to work well with FastRAM.
>
>Personally I like SpeedoGDos, and would rather have a patch or
>program that will control the Blitter than to have to install
>NVDI just for Blitter Control.

You still haven't got the picture. Just turning the blitter off
is no good, because you must then have software that can do the
corresponding work.

Falcon TOS does not have any software routines that can replace
the work done by the blitter. There is no 'software blitter'
like there was in all earlier TOS. The only way to get one is
to have some software that implements one, and the only software
known to do that is NVDI.

Apparently fVDI should also make the system work without accessing
the blitter, although I have still not had time to test this properly.

AFAIK no other software than these two can do the job right.

>>When I do the same I usually do reach the desktop, but as soon
>>as I move the mouse into a menu the system bombs every time,
>>and the same thing happens if I try to open a drive, or do any
>>other thing that updates the display.
>
>Yes, thats exactly what I experience.
>Just a simple program to control the blitter at all times?

Nope, control is not enough. It must replace it with software
routines that do the same job, as well as ensure that the blitter
is not 'turned on' again (enabled for use by TOS that is).

>>Getting this right is valuable even if it doesn't eliminate your
>>CT2 turbo boot problem.
>

>I thought I saw a posting from you about that?
>There is no mention of a small patch board in my docs. I certainly
>did not receive one and if I should have then I want it.

Apparently Centek have modified the CT2 installation procedure since
I got my CT2 kit, as discussed in another post. Apparently you had to
install wires directly in some sockets instead, to achieve the same
connections as performed by the 'MODULE' board of my own CT2, and as
also used with the earlier revision A (if I am correctly informed).

>
>Could you please be more specific why that would be a problem?

I am not going to 'explain' why XBRA protocol is required for all vector bending yet again. This has been done sufficiently often in the past, and I'm sure it can be no news to you. Even Atari finally saw the light and made it a required standard long before their eventual demise. I will only explain some of the special rules of XGEM bending, as that differs from other vectors.

>AES hooks into the trap as well, and as AES does not use XBRA,
>the information wouldn't be accessible anyway.

It doesn't quite work that way. It is true that AES 'bending' does differ from most other vector bending of TOS, as the XGEM vector is used for multiple function dispatchers, and is handled differently from all other vectors. It can be linked to, with different result, both before and after TOS itself adds its own AES link, and some 'benders' even do it both ways.

Still, whenever more than one 'bender' can be involved for the same vector, which is certainly true for XGEM, both before and after the linkup of the TOS AES handler, then XBRA protocol is of value.

Think about it, and you'll soon realize that the GDOS link could be installed 'between' two other 'benders' thus breaking the contact between them. That, alone, could have some negative effects.

It is true that the full 'chain' is not available after TOS links its driver in, but that only splits the chain into two parts. One 'above' the TOS link (later), and one 'below' it (earlier). And it can be important for cooperation between 'benders' for there not to be any additional breaks in either of the chain parts.

One typical situation where it is very important, is when several \AUTO\ TSRs exist and the ones booted later need to detect presence of the others that implement some VDI or AES enhancements. Linking in a GDOS without XBRA can then prevent proper recognition of some installed enhancement.

For such a case the fact that TOS will break the chain towards the
end of the boot sequence lacks importance, as the existence of the
chain up to that moment has already had its needed effect. There
are of course other more complex examples too, but this fairly
simple one should suffice.

----- snip ----- re: my homebrew-patched AMC_GDOS version
>
>The 3.* versions of AMCGDOS are free downloads, but certainly NOT
>public domain.

Thank you, that answers my question. The version modified was 3.21
and is thus included in the version range you mention, and this
means I can't distribute it on my homepage. Too bad, but that's it.

>In particular, it is not allowed to modify it without
>the agreement of the author.

You are mistaken as to what any author can or can't forbid through
a copyright claim. Not even an outright patent can inhibit the
freedom of any user to modify any software or hardware product in
any way he pleases, as long as he keeps the modified product for
his own use only. Copyrights and patents only apply to distribution
of the copyrighted material or the patented product.

The only way to legally bind a user so as not to have that freedom
is by getting his agreement on a specific contract or other binding
agreement to that effect.

>It certainly is a good idea to have it in a known place. So we should
>try to find the latest version and place it somewhere. However I don't
>agree that it needs to be modified to be useful.

I suppose it can be useful even without XBRA, although in a limited
way, as there are many situations where extra breaks in XBRA chains
will cause trouble.

>According to swedish law the program is covered by copyright if it is
>copyrighted, unless the holder has set it free. However, if you make
>alterations, like patching, the program counts as a separate work!

I think you are wrong here. Minor patches, that don't affect the major
part of the code, these do not revoke the rights of the original author
of those major parts.

>If your homepage server is physically situated in Sweden it has to abide
>swedish law. And swedish law only. So even if this swedish perspective is
>unlawful or unethical in other countries it's perfectly legal as long as
>you're on a server in Sweden.

In that you are correct, though jurisdiction on Internet and over Internet
users is somewhat tricky. For example, if I have free ISP accounts in
other countries I am still, as every swedish citizen, bound by swedish law
too in what I do on those accounts. In effect, the user of any account is
bound by the laws of both his own country and the host country, and for
that account he only has the freedoms allowed by both countries.

In any case, in virtually all countries, it takes major reworking of any
copyrighted material to make it constitute a legally separate work, which
can then be copyrighted independently of the original. My specialized
patches for the vector bending of AMC_GDOS do not constitute such major
reworking, so I do not have any rights to the work as a whole.

>The law stretches to the borders of each country.

It also stretches to all citizens of the country, wherever they are.
(Though it is then often difficult and impractical to enforce.)

>There is an interesting copyright feud about Mein Kampf (Hitler's book)
>which was printed in Sweden, but supressed by the Free State of Bavaria,
>which claims to be the copyright owner. The swedish publisher claims that
>FSB cannot just assume copyright over someone else's work and that by the
>author's death the copyright belongs to no one, since AH has no heirs.

That is IMHO correct, and the copyright should revert to Public Domain,
though I must say that in this particular case I couldn't care less.

>The whole matter is further complicated by Mein Kampf's being a politically
>very sensitive publication. Which GDOS isn't...

That is correct, but by my own evaluation my changes are not extensive
enough to entitle me to copyright the altered version. Consequently I
will not do so, even if some idiotic legislation does grant me that right
in spite of all ethics. I do have some standards of my own after all.

> upon a seller of cubase 3.11 with manuals and everything......so i guess it

Is that an ST, and STF or an STE. If it's an STE, then go for it, and
upgrade RAM to 4Mb. If not, then go for the MegaST2.

Cubase 3.11 will require at least 1Mb to run, but some functions will be
disabled unless you have more RAM. 2Mb is ok, 4 is perfect.

> ever distribute software in Sweden! Hence, it most likely isn't true.

It is true. However, the needed "amount" of modification has been heightened
since the 80:ies. It used to be so that if you changed one single pixel or
one single byte (or bit, which amounts to the same thing in this case) in a
binary file it became a new work, which philosophically is true... Nowadays
you must change more than one pixel, but you still have the possibility to
hack into things and call them yours.

> >Any proceeds from sales of such a reworked
>
> It would be interesting to hear the end of that statement.

Sorry about that, my fault, not the providers...
The continuation reads:

Any proceeds from sales of such a reworked... piece of work must, if the
original work is copyrighted, be shared with the original copyright holder.
In the first hand by contractual or other agreement, in the second hand by
ruling of a court.

> 'Now, let's see. I can change the spelling of this menu item and then
> sell MicroSoft Word2000 as MyWord I for $100. I'm going to be rich!'

This is perfectly legal providing you have an agreement with Microsoft.
If you don't, they may sue you and you will have to compensate MS with what
the judge decides.

If we look at a reasonable example, where you translate and adapt MSW2000 to
a foreign language, say Klingonese, and redesign the looks of the program
and call it MyWord, then it may be well possible that MS sells you each
license for say $10, letting you pull in $40 to yourself. The resting $50

will likely go to the resellers.

The law will not forbid you to do this without the consent of MS, but you'll likely be forced to pay MS the amount seen fit by the court.

Normally it pays better to have an agreement.

> >If your homepage server is physically situated in Sweden it has to abide
> >swedish law. And swedish law only. So even if this swedish perspective is

> That may or may not be true. It would hardly help people from outside
> Sweden in any case, since they could be breaking the laws of their own
> country if they download and use the program.

The part about the law's limits to the borders of a state is correct.
For instance, Americans who travel abroad can enjoy all the forbidden forms of sex that the laws in each county, state or the entire USA forbids in the laws. A visiting 17-year old boy and 16-year old girl can have legal sex in Sweden, but not when they return to USA.

When it comes to downloading software, this gets little murky. A PRG could be "scrambled" so that it doesn't look like the original at all. Then a downloader can unscramble it to assume the form of the original program, and no laws have been broken.

> >which claims to be the copyright owner. The swedish publisher claims that
> >FSB cannot just assume copyright over someone else's work and that by the

>
> 'Assuming copyright' does indeed seem like a rather strange practice.

If I remember right, the Free State of Bavaria confiscated all the property of Adolf Hitler that was on her territory, like the house in the mountains on the border to Austria. The book Mein Kampf was written while AH sat in prison, also in Bavaria. Later it was published several times in Germany and abroad, but it is doubtful whether FSB really has the legal copyright in this case.

Most likely is that FSB assumed the copyright to be able to supress the further spread of the book, which has prooved to be true in the swedish case.

A wellmeaning but stupid decision in my opinion. The brittish queen had read Hitler's book during the Chamberlain journeys to Germany ("Peace in our time!") and became convinced that the writer must be a madman or utterly evil individual. She, for one, didn't turn nazi...

Well, it seems we lost ourselves a bit here...

The most reasonable solution for URA would be to create merely a patch program. This would mean that you'd have to provide your GDOS on your own. Ronald's program would then grab this file and "redo" it. The resulting file would be the patched, enhanced GDOS.

And no copyright problems.

MG

Yes, iï¿½m too..
Must bee new. I know only boards with that smal patch board.
(Also on that smal boards are the jumpers no 1 and 2..)

> Can you tell me what U62, U63, U67 and U68 are for on a stock Falcon?

> Also what does the CT2B modification of U62 and U63 do exactly?

All four chips are PALs, bus emulation. Modifying some signals for
accessing the old falcon cpu. With a "new" cpu on ct2 board all these
chips are not used. Centek only use two sockets to pick up some signals
from mainboard.

Wow, thatï¿½s a lot. Maybee all what you can do..

> Is there any other modification that is done with the CT2B that
> would cause the SCSI drives not boot/work in Turbo modes?

Try to replace the resistor on SDMA (DMA-Modification) with a variable
resistor of 470R, justify this variable resistor as long if you have the
best scsi access. If you have scsi access well, remove variable resistor
use an ohm meter to check resistors value between contacts if you used
Notify the value, replace variable resistor with the value what you got
from your ohm meter...

68R, what centek deliver, must bee not good for all machines.

Try to experiment with this value of 68R -+

Do not reduce the resistor down to < 50R, machine like to stuck..
SDMA with no clock doasnï¿½t work.

No more ideas left in the moment..

> The resistors at R221 and R222 have to be removed and these

> the CT2B may not work correctly.

Eh.. iï¿½m not the mainboard developer.. :)

These three resistors does not more as to split the clock for three
areas in any falcon. Falcon mainboard generate 32Mhz master clock and
put it thrue L102 into the COBEL chip, COMBEL reduced the clock to 16Mhz
and deliver this signal thru a zero ohm bridge to our thre resistors.
One for SDMA/SCSI/SOUND, second for FPU, third for CPU/Bus.
Thatï¿½s all. (Description in DOITF030)

Resistors reduce the power source for the main line (16Mhz COBEL output)

Also you can shorten any one of this resistors (normaly 33 R each)
without any risk of damage. The only risk is to drop down 16Mhz main
clock, machine stuck without clock.

CENTEK use this point to take/deliver clock signals to/from the
mainboard. Same as all other accellerators too.

Same as any "ClockPatch" doing. Pick up clock from mainboard, stabilize
it, deleay it, put it back to the mainboard.

(Mainly for the bullshit SDMA circuit)(The main bottleneck in this nice
machine and the manager of all SCSI trouble..)

All other parts normaly works well without any pig pack ttl chip..
Normaly..

But some falcons..

>
> Do any of these resistors have anything to do with the SCSI in
> Turbo Modes?

Yes, look to the SDMA part. Below the SDMA comes the SCSI chip in this
nice atari development..

> About the only thing I know to do now is to get a shorter SCSI
> main cable. Unless there is some other modification that effects
> the SCSI in Turbo Modes that I can look at.

You try it, so i think you have all done.

> Also, I don't have the latest version of HD Driver. Could that
> have anything to do with it?

Normaly not, more for IDE. Latest HDDriver contains the best routines
for newer IDE device. (Hope thatï¿½s correct, Uwe correct me if iï¿½m
wrong)

> I'll have to check my settings in HD Driver and make sure they
> are correct. What SCSI ID number should the Falcon be? I think
> the CT2B software sees the Falcon as a ID of 7.

Quit that, thatï¿½s o.k
ID7 for the falcon (host) Other IDs are ok for any other device.

> Also should I have SCSI bus Arbitration set on in HD Driver?

Hm.. good question, you have devices they need that?
Arbitration is on on my chain.

> Is there any settings in the CT2B configuration setup that would
> affect the working of the SCSI in Turbo Modes?

No.

> From what I am seeing it is almost like the SCSI drives are being
> accessed to Fast and the information is getting scrambled, when I

> not. I know that in normal Falcon mode when booting, the slowest part
> is when HD Driver accesses the SCSI drives. It takes awhile before
> they are recognized. This also may mean the my main SCSI cable is

Yes, SCSI is the slowest bus on the hole falcon. SDMA chip quit his
job with more as fucking 1.8KB/Sec. transfer rate..
Also Falcon SCSI canï¿½t work faster anytime.

If you got scrambled informations in turbo mode, try to use cecile as
test. If you got the same results, try to prepare the SDMA modification
as i describe upper. After that, try again.

Also i seeï¿½n that some people put cecile.prg into the autofolder on c:/
Thatï¿½s not necessary, cecile comes out of the flash an pick up
automatically all connected devices, IDE and SCSI.

Some people with scrambled informations in turbo mode does ecactly the
same :)

With "cecile" switched on in setup, all hard drive things done, no more
drivers needet. If you swiched to "external" HDDriver.sys must bee
present on IDE0, first partition, root. Maybee drive c:/

Boot sequence -> Floppy disk (if itï¿½s on) IDE, last SCSI

> Also, the last time I installed the Flash update, I was in normal
> Falcon mode, But not sure if I had the SCSI drives connected or not.
> If I had the SCSI cable off and installed the Flash. Would this
> cause a problem when trying to use the SCSI in Turbo Modes?

Thatï¿½s ok. No further results. Devices must bee not connected if you put
in a new flash. The one and only is to watch the settings.
Recheck your settings after flashing.

Use the same settings as before.

(Mostly you have nothing to do, put in the new flash.bin, restart,
thatï¿½s all, not effects to any device) (Als long i do that here)

> Also, I tried Apex version 2.41 and I can now use it in 640 x 400/480?

Hm, i have to try that..
I start apex allways in 256 colors, apex switched to other resolutions.
But apex 2.41 it is fast :)

Good joice to test the modified (fast) :) DSP..
(Spray mode)

I assume you mean "disk cache" above, not "disk ram" as you wrote.
(Mainly because the latter makes no sense. ;-) Or in other words
that you set the cache size in the right half of that dialog to 1MB,
and the one in the left half to zero.

It is also this dialog that you will need to reenter now and then to free
the disk cache space that has been used up, using the "Free cache" button
in the right half of the dialog.

> The page loads and the words "Formatting text..." appear in the url
>header and the A:\ drive starts running with a 'chip-chip, chip-chip'
>sound as if it were looking for something.

Hmm, you may be right...

> I'm stuck at this point but I am so close.
>
> Any ideas?

Yes, but it assumes you have forgotten something...

As you will need to use a disk cache on the floppy disk, you must also
tell CAB not only its size, but also its location. I suggest that you
create a folder named "WEBCACHE" on the floppy, enter the CAB menu
command "Options"/"Paths", and click the field labeled "Cache folder".

That will bring up the file selector which you should use to select the
newly created folder "A:\WEBCACHE\". CAB will then start to create lots
of subfolders in that folder and once it has done this (drive goes quiet)

the cache should be ready for use. But don't forget to save settings too before you proceed, so that the cache location is not forgotten by CAB.

This is the same stuff you must have done when installing CAB on hard disk too, but it is usually only needed once, which is why it may have slipped your mind on this new installation.

>That means you'll get a lot less flicker at the same resolutions.

I know, but that means accessing the screen data at a much higher rate, thus increasing the percentage of time that Videl blocks ST-RAM, and that is of course the main problem with maintaining effective CPU speed on a normal Falcon. Of course, some of these units may also accelerate Videl, and that would make it a different story, but unless they do that I see them as more or less useless.

>>and flexible Multisync monitor was used, and to use higher rez on a Falcon
>>with safety you must have a real accelerator anyhow.
>
>The resolution in itself is no problem for the Falcon, but if you're
>using an 8 or 16 bit mode things can of course slow down a lot.

The real problem is X_resolution times Y_resolution times bitplanes, so there is no reason to isolate the bitplanes in taking the blame. Each of the factors is equally responsible, but it is very common for people to forget that going from 4 to 8 bitplanes inevitably doubles Videl load.

>I never had any problems whatsoever on my unaccelerated Falcon using
>1008x608x4bit (at something like 55-60Hz, IIRC).

I agree, and as I stated myself, I used 960x720x4bit at 75 Hz interlaced. If you calculate the effective loads of our respective resolutions you will find that they were very close to each other.

>>>Yes, NVDI should give more speed.

>patching things a bit. This was done in the AB040 Toolkit, but
>apparently Centek seems it's a good idea to force people to buy NVDI

>(but see below).

I think they just didn't want to have to implement a proper 'software'
blitter, so they just skipped it, keeping their patches to the bare
minimum needed to complete the TOS 7.x boot.

>As Ronald said in that other thread, it looks like the blitter simply
>doesn't work at 25MHz, though, so such patching might not help.

I'm not sure why you say the chip runs at 25MHz here, unless it is the
old habit of halveing the Videl frequency. I consider it incorrect
though, as the physical clock signal is 50MHz, just as it is 32 MHz
on a normal Falcon.

Be that as it may, I do believe the blitter has very serious problems
at the CT2 turbo speeds, even without any FastRAM present.

>>>Well, I've went as far as to try and boot into Tos 7.x but
>>>didn't have NVDI installed so no blitter control. It would
>>>do the Ram and Fast Ram testing and etc. But I think it will
>>>Bomb if NVDI isn't installed to control the Blitter.
>
>If you don't have NVDI, why not give fVDI a try?
>It will solve your blitter problem and doesn't cost anything.

Those are very strong arguments in fVDI favour of course.
Especially for CT2 users, where the blitter problem is fatal,
whereas it is only an 'inconvenience' for some other accelerators.
(With more extensive TOS patches as you mention above.)

>For now, only the monochrome and 16 colour drivers are really usable,
>but there is a 16 bit one as well. For 256 colours you'd have to
>write your own, or convince someone else that it's needed.

Is there a particular problem with 256 colour mode ?
I'd say just about every Falcon user would find it 'needed'.

Even now, with my CT2, it is inevitably the bitplane mode I will use
for my main work resolution, as the 16 bit mode will not work in the
highest resolutions (not just due to Videl load, but to other limits).
My new work resolution, achieved by Videlity, is 1280x960x8bit at 61 Hz,
displayed on my (recently repaired) 19inch multisync monitor.

Well, I'm not an expert, but I do have two syquest drives hooked to
my system. Depending on the software you are using (TOS and hard
disk driver), the size of the 200 meg might be a problem. Certainly,
the drive needs to be partitioned in an Atari compatible format.
Until that is done there is no way for your software to "find" it. I
don't think you need to do a low level format, just a repartioning.

You should try and partition based on the SCSI ID number of the 200
meg syquest. As long as you are sure what that number is,
there should be no danger of trashing your boot drive.

I already have this; it's called 'CACHE' and has subdirectories of A
through Z in it. There is also a file called NEWCACHE and something else,
the name escapes me right now. I can make a new one just in case and
delete the old CACHE directory.

> This is the same stuff you must have done when installing CAB on hard
> disk too, but it is usually only needed once, which is why it may have
> slipped your mind on this new installation.

I remembered it from the HD install. I may copy everything over to a new
disk in case the floppy is trashed from repeatedly shutting off the power
to get out of the hung session. After 15 minutes of 'chip-chip chip-chip',
it can't find what it's looking for so I have to power down to break the
deadlock.

I'll try the Free Cache button again before entering the first URL so that
I have maximum disk cache. I'll report my progress.

> is identical. (I certainly hope it is, or we're 'gropin in the darkness'.)

Yep, so it is. I think thatï¿½s the point they never sell ct2 boards to
people how was not like to use the fitting service.. :->

Module is missed.. :)

> The CT2B kit I received did contain a small extra board, and the mounting
> of it is clearly described both in the 8 page (A5 format) manual, as well
> as in the corresponding files on the diskette supplied in the same kit.

Yep, so all the rest have to solder the socked..
The point for the fitting service, no new manual.

Regards, Robert

Suprised.. :) I think i was stupid to do that..

But it works for "B" boards, last week i fit one here.
Looks like it doasnï¿½t work only for "A" boards.
Tss..

Older boards.. forgotten island !? :->

>I believe you're not. In Sweden the law affects residents, permanent or
>temporary. Tourists for instance, must abide the laws just like anyone else.

Of course, but they must also obey the laws of their nation. Like I said,
they are covered by two sets of laws. One local set which applies immediately
and one which can only apply when they get back home again. Some nations
even keep spies here to keep track of whom they want to punish for political
reasons when/if they go back home. (Sounds weird, but it is a fact.)

>The swedish citizenship affects you only in some very special cases when
>you're outside your own country. If you should betray your country is one
>example, should you commit war crimes or crimes against humanity is another.
>Otherwise, swedish jurisdiction is powerless abroad.

I never said our government had the power to enforce any legislation abroad,
but that doesn't mean they can't hold citizens responsible for breaking the
laws if is something they 'care' about. Which usually means that it has to
be something associated with vote-gaining publicity, but also anything that
is important to other nations that our politicians need to 'trade influence'
with. That is where copyrights and patents can get involved.
(Though that would hardly apply to TOS software of course.)

>> It also stretches to all citizens of the country, wherever they are.

You are wrong. There are no territorial limits to the jurisdiction of a
government over its citizens as long as they do remain citizens. But there
are definite territorial limits to what that government is allowed to do as
long as the citizen stays in foreign territory. And it is mostly a question
of practicality that prevents repercussions for petty crimes when citizens
do go home again. Putting it differrently, "Why should anyone care ?".
If no one presses charges there won't be any prosecution, even for serious

crimes committed at home. I've heard of several such cases.

That is a possibility, but doing that right would be too bloody complex.
I would never feel satisfied with such a patchwork, so I am not motivated
to go that route.

----- snip ----- re: heavily patched KAOS TOS 1.4

I know, I tried it for a while as well, though I didn't bother to translate
it into swedish. It had some nice features, but there were some problems
with compatibility as I recall, possibly because too many programmers still
did not access things in a sufficiently TOS-independent manner.

>Since I owned the TOS chips I could do whatever I wanted with them. Even
>make copies. Remember that it's the ownership rights that are the backbone
>of the Roman law, and consequently the laws of all european countries.

I know. A murderer can get out in less than a year, but someone who gets
caught evading taxes or something similar will do serious time for it.

Of course, in the days of roman power there was no crime you couldn't buy
yourself off punishment for, though it was more expensive if the crime was
of an economic nature. I've read some collections of Cicero's letters to
his various friends and associates, and it was almost nauseating how much
they took heavy graft and bribery for granted. Many were even proud of it !

I see, but as I've said before, I doubt that blitter can be reliable at
50 MHz, so that would probably not work well for a CT2.

>I'm pretty sure the blitter is running at 25MHz. My Falcon docs seem
>to have disappeared (I think I lent them to someone a year or two ago...),
>though, so I can't check it.
>The old Mega/STE blitter certainly ran at 8MHz and I _really_ think the
>Falcon just doubled that.

Well, that depends on how you mean it of course, but in this case there is
no separate blitter chip in the machine. Instead the blitter function is
distributed over other chips. I haven't seen any definite spec's on this,
but simple logic reveals some things that must be true given Falcon design.

The only chip with direct access to DRAM address lines is Combel, so part
of the blitter must reside there, but it is only Videl that has direct access
to the DRAM data lines, so it should contain the rest of the blitter. Both of
those chips are clocked at 50 MHz by a CT2.

My conclusions are also partly confirmed by the Falcon service guide, which
refers to "halftone RAM" as being "Internal RAM in BLIT portion of COMBEL".

Hmmm, I can't find any verification that the BLIT logical operations are
performed in VIDEL, as they really ought to be, and that explains why the
Falcon blitter is not so fast as it should be. COMBEL must fetch data via
VIDEL, perform the operations, and then store data via VIDEL again, and in
all this COMBEL must act as a bus master, locking out the CPU. This means
that to properly lock out a 50 MHz CPU it needs signal speed sufficient to
manage the bus arbitration in time to prevent access conflicts. Failure to
do this fast enough could explain why blitting fails even in ST-RAM at the
turbo speeds.

>But physical clock signals are really rather irrelevant without further
>information. They get divided and multiplied all over the place and
>for busses it's much worse than that (bus width, multi-clock protocols,

>handshaking, double edge triggering).

That is true, but in speaking of 'clocks' those are what we have.
Speaking of 'effective speed' is something else of course.

> out of registers.)

Actually I have worked on such code a bit, in adapting the ColorTOS
program (on my homepage) for various resolutions. This did involve
modifying some of the VDI functions that draw on the screen. And it
was a bit awkward in the higher modes, although I could simplify it
some since the icon source data only had 4 planes. Only destination
data could be in 8bit or 16bit formats.

The work I did on screen emulation filters for my LaceScan project is
also related to this kind of work, although that was much simpler in
nature.

>Earlier I almost never used any graphics modes besides 1008x608x4bit

>
It is only natural to look to your own needs first, and take the rest
later.

>>I'd say just about every Falcon user would find it 'needed'.
>
>I certainly didn't, and if others do they should contact me.

I agree, so they should, but I know from experience how hard it can be
at times to get any feedback just by waiting for mail. In most cases
people never do mail their feedback to the author, even though they do
talk a lot about it in other media, such as newsgroups ;-)

>NVDI (which isn't at all bad at most things) was just too painfully
>slow in Falcon 8 bit mode,

On an unspeeded Falcon it naturally was, as that loaded Videl twice as
bad as the 4 bit resolutions did. With an accelerator, however, the
8bit resolutions are the most useful ones Videl can offer.

>and in 16 bit there were no usable resolutions.

That has little to do with NVDI itself, since it is not a resolution enhancer, such as Videlity. The strength of NVDI's drivers is that they are compatible with any resolution using the same bitplane methods. Thus NVDI is fully compatible with all VIDEL-based resolution enhancers that I know of, such as Videlity, Videl Inside, etc. And they can give quite useful 16bit resolutions.

I would not call either 768x576 or 640x480 useless, and though some may fail to get the former, all accelerator users should be able to get the latter resolution in 16bit Hicolour mode. But again, an accelerator is needed to make efficient use of such resolutions.

NB: I am speaking of uninterlaced VGA resolutions here. Anyone who can stand some interlace flicker can get similar Hicolour resolutions just by using Videlity or VI2 with a PAL monitor or TV. No accelerator is needed for that, as interlace and PAL timing cuts Videl load to one quarter of what it would be in a similar uninterlaced VGA resolution.

>>Even now, with my CT2, it is inevitably the bitplane mode I will use

I can understand that. I haven't worked much on real dithering, but I do understand the kind of difficulties involved.

>>displayed on my (recently repaired) 19inch multisync monitor.
>
>Well, while you're waiting for the Eclipse to be released (should be
>any week now), perhaps you could write an eight bitplane fVDI driver? ;-)

I am seriously considering it, but it is a matter of getting into your way of doing things, with a minimum of docs. I was disappointed to find only source code for graphics cards on your site. It would be much more useful to have the 4bit VIDEL driver as an example, as that is a more familiar resolution to me.

I have now made some rather extensive tests of fVDI with the 4bit VIDEL driver.

My intention was of course to test the 1bit driver too, but I never got it to work. fVDI never did switch to a monochrome resolution, but stayed physically in my boot resolution, which is 640x480x4bit, and then it is no wonder that the driver only produced garbage pixels, and only on a small part of the screen. So, the remainder of the tests had to be made with the 4bit driver.

At first I experienced bombs on every boot, not when fVDI started, but a bit later when it was time to launch desktop. I managed to 'backtrace' the code to the triggering function calls, and noted that these where a pair of calls like v_show_c(1,1) and v_show_c(1,0). This appears to be how desktop does activate the mouse cursor after the rezswitch is completed.

The strange part of this was that the code bombed because the mouse draw
routine attempted to store pixel data at address $00E1C744, which is in the
TOS ROM area !!! But investigation soon showed that this was only because
that area does come immediately after the normal screen area.

Surely this must have happened occasionally on your system too !?!
Unless the AB hides it, like the CT2 would in TOS 4.x mode, if I had not
installed a small utility that fixes the write protection of ROM in PMMU.
(Perhaps you need to test that on your system.)

The problem appears to be that the mouse handler part of your driver does not
initialize the mouse coordinates. On further reboots I managed to trace into
your mouse drawing code, and saw how it fetched a Y-coordinate of 845 and did
use this value without checks or limitations to calculate the pixel address.
As the vertical resolution was only 480 pixels this inevitably lead to using
an address beyond the screen, in the TOS ROM area, for drawing the mouse.

All the figures match for producing the access address that caused the bombs,
so there is no doubt about the facts here. You need to init the mouse handler
better, and that needs to be done at each rez change, as even after an original
init the coordinates may need to be limited after switching to a lower rez.
(I had to do the same in my LaceScan drivers on ST's once upon a time...)

I used the 'triple switch' method to activate the old mouse drivers of TOS,
as described in the FVDI.SYS file, and proceeded to test other things.
Now the boot could complete and desktop appeared, and this worked correctly,
so that it is now verified that fVDI can do this job for a CT2-Falcon.

I also tested using some non-standard system font sizes, and that too did
work, although it naturally had some inevitable negative effects on the
formatting of dialogs, since text character cells are used in calculations
of GEM for such things.

I also tested that it was still possible to use my VDIFont tools to override
the system font of fVDI (for more flexibility), and that too worked fine.

When used with NVDI, however, that appeared to take over the font handling
completely, and when used 'below' NVDI I am not even certain that any of
the fVDI code was still in use. I had no indication of it anyway. With
fVDI used 'above' NVDI I did get higher speed in program launching, and in
some other operations that affect windows, but like I said earlier, the
special system font was lost in this mode too. (But VDIFont still worked.)

So far so good, or at least as good as expected, but now we come to more
negative results...

I tried combining fVDI with Videlity, trying them in both of the possible
relative positions, and neither worked properly. Apparently fVDI does not
allow more than a single resolution per driver, unlike NVDI, for fVDI now
drew 'two desktops side by side' in the bottom quarter of the screen.

As Videlity had set 1280x960x4bit that bottom quarter is exactly what would
have been the proper screen area in a resolution of 640x480x4bit, which thus
seems to be all that this fVDI driver will allow. That is a serious drawback.

I don't see why the driver can't adapt to the real screen base and size as
set up by Videlity. There are plenty of other drivers around that can do so.
(Those of NVDI, those of MagiC's VDI, and of course those of normal TOS.)
This is something that you will need to improve.

Well, that's all for now then...

According to the docs, the SB II software was written by the authors
of NVDI. And if you use SB II with NVDI then SB II will be even
faster.

I do think the hardware does provide a increase or boost so the rest
of the system is not slowed down if higher resolutions.
I see no point of the hardware if it didn't. As you point out
there are software only solutions to get higher resolutions.
Most of the default VGA/SVGA resolutions seem to not be in interlaced
mode. The Desktop Icons in 800x600 256colors are as large as in
640x480. 1280x960 in 16colors seems to be the only default res, that's
in interlaced mode. The Icons are much smaller in that res. but not
as small as one might expect.
Most of the software only solutions I have seen put 800x600 in a
interlaced mode, thus decreasing the desktop Icon size.

Is it possible with software only to get 800x600 in 256colors
in a standard resolution not using Interlace?

I did find it a bit hard to configure new resolutions with SB II.
But the hardware/software supports just about any type of monitor
even RGB.
There is also BlowUp that has hardware similar to SB II, but I have
never tried that one.

>
>That sounds very odd to me. I never had such problems. At very high

>
>

>ST-Low should never be necessary just to get a decent baudrate.
>If that is the case then the system is very very sick...
>
I don't think that my Falcon was sick in any way. I have heard from
other Falcon owners that also could not do 57600 in 640x480.
Also have heard from some Falcon owners who could go higher than
57600 without any modifications.
My Falcon has always had a Excellent Sound System without any
modifications. I get excellent results with D2D recording.
No Clicks or BassBoost in the Audio. Also everything else has
worked great with this Falcon. I just happen to have one that
did not like 57600 in normal VGA resolutions.
There may be slightly different Falcons produced that had abit
slower modem port speed.
AFAIK, the modem port on all Falcons are buggie, We have always
need software patchs such as HSmodem to do higher port speeds.
So it could be that my HSmodem settings aren't what they should
be in order to do 57600 or higher with the stock software.

Now with the CT2B installed I can easily do a port speed of
230400. I bet it would go even higher if possible.
This just goes to show how good this CT2B I have is.

>
>A screen blaster may be able to increase system speed slightly, by

>the higher rez used interlace, as opposed to the lower one, and that
>further differencies in scanrates also existed.

The 1280x960 16colors I got with SB II was indeed a interlaced mode
as far as I know. Also this is about the only default res in SB II
that is in interlaced.

>
>The mystery here is not that your system worked as it did in the higher
>rez however, but rather why it worked so horribly bad at lower rez.
>With proper use of interlace and multisync resolution timing I have
>been able to use 960x720 without experiencing any problems with serial
>rates of 76800 BPS. I avoided higher rez to avoid serial problems.
>Now (of course) the CT2 has removed that limitation as well.

Can you use 640x480 in interlaced Mode? If so I did not know that
was possible. I thought that 640x480 was a standard non-interlaced
resolution.
I have asked many times in the past about getting 57600 or higher
in stock standard 640x480 or higher. Most said that I needed a
accelerator to do this.
Again the problem with the port speed at 640x480 with the stock
Falcon could be due to HSmodem settings not as good as they should
be.

If you have a HSmodem configuration that will do 57600 or better
in 640x480 or higher resolutions on a standard Falcon. Then I'd
like to try it here and see if indeed my Falcon will do this.

>

>
>AFAIK no other software than these two can do the job right.

I do understand that more is needed than to just turn off the
Blitter. I would like to have a program that does what NVDI
does to allow the CT2B to work correctly with TOS 7.X without
all the other features of NVDI. If such a program was made, I
feel that it could me more easily tuned for TOS 7.X and maybe
give even better results than NVDI. And if I want or need the
other features of NVDI then fine, that would be another option
since it works correctly, at least thats what I've been told.

I don't mean to Knock NVDI, I have used it before. I just
don't like the idea of having to install a program such as
NVDI just to use one of its functions. Even though it is a
important function. I like options and more than one way
of doing things. Thats why I enjoy using Atari machines.
I'm sure lots of folks use NVDI and all of its features
and find it very useful. Personally at the moment, I'd
rather have another program for the CT2B TOS 7.X mode.
If one doesn't come about, then I'll probably have no
choice than to use NVDI.
fVDI may also work, thats something I will try as I go
along. But I need access to all color modes, Including
256colors.

>
>Nope, control is not enough. It must replace it with software
>routines that do the same job, as well as ensure that the blitter
>is not 'turned on' again (enabled for use by TOS that is).

ok, I didn't word it right then. A simple program or patch that
controls the Blitter and replaces the Blitter with software
routines that do the same job, as well as to insure that the
Blitter is not turned on again. For use with a CT2B in TOS 7.X

>>
>>I suppose so, but at the time it worked great as it is set now.
>>So, I didn't bother trying to fix something that worked.
>>But, now I'll have to check into that. I'll probably
>>start with the CT2B wire and make sure its short and not
>>over a chip and etc.

****
I went thru all the SCSI stuff, including changing the SCSI
drives around, messing with the termination, I even shorten
the DMA wire, None of this helped at all. I then put the
SCSI drives back in the working configuration like they were.

But this time I installed Cecile on the IDE Drive C boot partition.
Guess What?
The Falcon booted up the First time I tried it, in Turbo Mode
using Cecile instead of HD Driver v.7.71. All SCSI Drives
came alive very Fast. No problems at all. This was with this
long 5foot SCSI main cable.

Since most of the documentation of Cecile is in French, I was uneasy
about installing it. I should have did this days ago. I knew it
was something simple. Apparently something in HD Driver is either not
set right or it is not compatible with my CT2B board.

Cecile has a nice configuration setup that is in English however.
I've not tried the Fastest ATA IDE settings yet, but will soon.

Now what I really need is some English docs on Cecile or any info
about it.
I have several IDE partitions over 800megs. AFAIK they seem to work
fine. But I need to confirm that CECILE does support partitions
of 800megs or more for IDE and SCSI hard drives.
If anyone can help or give any info on Cecile, it is much needed.

>
>Apparently Centek have modified the CT2 installation procedure since

I'm not sure if there is any main board differences. But everyone
said that HD Driver would work in Turbo Modes. It sure will not here.

I've tried about everything I know of trying to get it to.
Do you have HD Driver.SYS in the root directory or the Auto Folder?

Thanks,
phantomm@kih.net

941. Iomega ZIP for STe

Newsgroup: comp.sys.atari.st

>into a couple that have 44 meg removables and one 200 meg removables. The 44's
>work fine, but I'm having trouble with the 200.

I did have a 44meg one, but couldn't get it working:-(

Another member of WRAG has it now, and he got it working on his system.

> I hooked it to my hard drive with a SCSI cable... the ID was fine and it was
>seen on bootup. My hard drive is a 105 meg partitioned as drives C, D, E and F.
>I installed a drive G - hoping it would show the Syquest - but when I clicked
>on it it said "drive not found".

You have got them with different ID's havn't you?

> I put in my ICD disk thinking I needed to format the thing, then read the docs
>that I might format the WRONG drive... I certainly don't want to reformat my
>hard drive by mistake!
> Can someone H-E-L-P???

When it comes to formating the syquest make sure that you are formating
the correct drive by its ID number, as each drive should have a different
number.

Hi All

I am having something very weird occur with the latest version of Sting in that when it is installed and I am using any software or even just opening windos for any of my drives, the window opens but display a blank window, and the the ST locks up.

Does anyone happen to know why its doing this?

In the meantime I'm back using Sting 1.08

Also I notice that the latr version doesn't have the modules for the midi port or the centronics port, are they no longer supprted or do you use the files from 1.08 to utilise these ports?

Any help would be most appreaciated.

Thanks for all your replies. For the record - I succeeded, using
unzip.ttp v5.13 - Thanks Jim for pointing me to that - I found it on
F.6321 on the Floppyshop Gold CD.

Ronald wrote:

>Yep. The best way to deal with this kind of situation is to unpack

I was using a VFAT partition under MagiC, but STZIP v2.6 wouldn't cut it.

Terry wrote:

>ZIP20 is, sort of. Unfortunately, all files it extracts has the read-
>only flag set, so you can't move or delete them without changing the

I don't know if this is a 'feature' of the zipping program, but using
the unzipper this didn't happen. I dropped the zipped file onto
unzip.ttp, and the inflated folder containing all the files appeared
right next to the unzipper. I moved it out without getting a word of
complaint.

This unix port gets my vote! Thanks to Harald!

Just a suggestion: have you thought of writing a step-by-step guide to the
1040 setup, listing pitfalls etc and putting it up on a web site? I'm sure
this would be a valuable addition to existing information on getting Ataris
connected to the web.

It would help if you had said what make and model of modem you are
using. I would have thought that a standard PC-type cablwe should work
with most models. Do the lights on the modem work when you fire up your
comms program? If not, you may have the wrong modem port set.
You also need to watch the modem-to-phone cabling: There are two way
of wiring what appears to be the same plugs. I had problems when I
switched from a Sportster to an Accura - the leads looked the same so
I kept the old one, but found it didn't work. Switching to the correct
lead fixed things!

Your going to have a bit of a problem you might as well just buy the "Link
2" from ICD it's about $99
and a ICD DMA cable which is also about $29.99.
Then you need an external SCSI box with it's own power supply.

I don't know from any kind of personal experience. However, I can quote directly from the latest invers mailing with regards to the WSL99 Windows Pack:

The most important fact is that you can finally use the latest version of Calamus, take profit from our great variety of optional modules, and of course use your Windows system printer drivers.

Vuk,

When I installed my CaTT several years ago, I found that the PLCC FPU wasn't up to running at 50 MHz. I got another that was rated at 40 MHz (instead of the standard 33) and that solved the problem.

Another solution might be to cut the vanes in the case out around the fan. This increases airflow to keep things cool.

One more option is to buy a replacement power supply from Best Electronics in California. I believe you'll get a bit more power (which may be necessary, since the CaTT pulls extra current on the 5V line) and the fan moves a little more air.

Also, make sure you have the latest drivers.

Good luck,

Dan

968. Re: Original games ST in PC???

Newsgroup: comp.sys.atari.st
Date: 1999-06-22 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199906220000.a19590@lu.maus.de>
Source record: 76832

Hello "Nato,

n> Is it possible play the original ST games????
Some yes, most not.

n> How???
Install PaCifiST on your PC (http://pacifist.fatal-design.com/), not
TOSBOX
as someone mentioned here before (also watch out for a VESA driver for
your
graphics card if you have games with "tricky" graphic routines).

n> I have a lot of original games
If you have, you should be allowed to load the cracked versions of these
games from the web (AFAIR are there some at Fatal Design), because if the

original games are copy protected with a floppy based protection (most
are),
there is no(!) way to use them with a PC.

If they aren't protected or just protected with handbook queries, you can

read the games directly within PaCifiST or (more stable/compatible and
much
faster) convert them to a image file with appropriate ST or PC tools (i.e.

MAKEDISK for DOS at http://www.fatal-design.com/makedisk/).

I have an iMac, and I really want to transfer my ST disks onto the iMac, so that I can get at text files, stories, and documents I've created over the years, and play my favorite games... Unfortunately, Dust, a disk-image utility for Macs, doesn't seem to read my imation SuperDrive.

Is anyone aware of newer or more compatible Mac software, or maybe even of a totally different solution?

>the unzipper this didn't happen. I dropped the zipped file onto
>unzip.ttp, and the inflated folder containing all the files appeared
>right next to the unzipper. I moved it out without getting a word of
>complaint.

I just tried that on my Falcon with MagiC 5.11, and sure enough it
set the read-only flag on all extracted files. Others have
complained about the same thing, so I know it's not unique to my
system.

My unzip.ttp file size is 103,678 bytes. Does that match yours?

On Wed 23-06-1999 01:17, Joe M. Villarreal TOS'd the following:

>Cab 2.7 saves to the disk cache faster quite a bit faster than 2.5.

Perhaps, but that is more than offset by it ignoring the RAM cache.
It's downright annoying to have a 6 meg RAM cache, only to watch it
load the same graphics over and over and over again from disk,
rather than using the RAM cache. V2.5 was much more efficient in
that area.

Hi Roger,

RC>Any comments, please?
there is a second (independent from STZIP) ZIP package named ZIP20
with two different programs named /ZIP/ and /UNZIP/.

As I don't know if this package is able to handle long file names,
please do regard this hint as a suggestion only.

Me personally, I avoid long file names if I can for not to run into
troubles like those you just described.

If I'm wrong with ZIP20, you'll have to look for a friend with an IBM
compatible. Sorry!

Sometimes, ZIP20 is even capable to extract archives that STZIP
refuses to extract or where it complains about chechsum errors.

> too in what I do on those accounts.

I believe you're not. In Sweden the law affects residents, permanent or
temporary. Tourists for instance, must abide the laws just like anyone else.
The swedish citizenship affects you only in some very special cases when
you're outside your own country. If you should betray your country is one
example, should you commit war crimes or crimes against humanity is another.
Otherwise, swedish jurisdiction is powerless abroad.

> It also stretches to all citizens of the country, wherever they are.
> (Though it is then often difficult and impractical to enforce.)

As I said... This hasn't to do with practicality, it has to do with
territorial limitations of the state's power. A swedish person who steals a
car in the USA will not be punished for this in Sweden, even if there is
waterproof evidence against him.

> That is correct, but by my own evaluation my changes are not extensive
> enough to entitle me to copyright the altered version. Consequently I
> will not do so, even if some idiotic legislation does grant me that right
> in spite of all ethics. I do have some standards of my own after all.

As I mentioned before, you can well have a program that can be used as a
tool for each one to patch his own GDOS. It would be like the KAOS people in
Germany did when they offered their TOS 1.4 patcher, which greatly
refurbished the Atari product. It never worked on the swedish version of TOS
1.4, so I remember I had to buy a German TOS from a company in Kiel. After
the patching procedure I hacked into it and translated everything to
Swedish. The result was a really, really patched TOS...

Since I owned the TOS chips I could do whatever I wanted with them. Even
make copies. Remember that it's the ownership rights that are the backbone
of the Roman law, and consequently the laws of all european countries.

>
>All I ended up with was the empty folder, with its name truncated at
>the blank. I was then returned to STZIP's main screen with no error
>message.

I assume that you attempted to unpack to a disk with normal FAT system.
For that kind of operation this sort of result is common, when files
have been packed from a 'longname' filesystem.

Of course, my assumption may be wrong, and then most of the stuff
below is just a load of hogwash, as far as you are concerned... ;-)

>I ran the Check procedure from the main screen, which reported all
>files present with no inflation errors.

That is probably true then. The problem is not with the archive format,
but in the use of filenames that are illegal on the destination drive.
So that limitation is what we need to get around.

>Any comments, please?

Yep. The best way to deal with this kind of situation is to unpack the
files to a VFAT or other 'longname' filesystem. Under MagiC you can
even do this to floppy, and in fact I now always define B: as VFAT but
not A:, so I can use the same physical drive for both types, simply by
accessing it either as A: or B: (my falcon only has one floppy drive).

But if you have plenty of RAM, then a much faster way is to unpack the
archive to a ramdisk using a longname filesystem. XFS drivers for such
ramdisks exist both for MiNT and MagiC.

Finally, you may decide to make one of your harddisk partitions into
some kind of 'longname' filesystem, and again there are several ways
to do it, both under MiNT and MagiC.

Unpacking the 'weirdly' named files should not be any problem when the
filesystem allows this weirdness, and you can then rename the files to
more normal names and copy them in that renamed form to normal partitions.

The only problem is if the 'weird' names of files and folders are for
some reason required by the software itself. If that is the case you
will need to install them in original form on a longname filesystem.

I knew that you are well aware of XBRA importance, though I do not have
any direct memories of its introduction as I was then working in other
fields. In fact you and I have discussed these needs before, in other
contexts, and I know that you are no more likely to omit XBRA use from
your 'vector benders' than I am myself. We simply don't do that.

But I was not just speaking to you here, but also emphasizing how very
important it is never to skimp on using XBRA for those who are not yet
fully aware of it.

>> One typical situation where it is very important, is when several

>this trap needs to find out about other's, it should use the cookies
>that they install.

What you say is true, but some programs don't use cookies, and the fact
that Atari themselves were not fully consistent in implementing XBRA,
as they really should have done even for TOS itself, that is no excuse
to omit it in any other program. (Whether it is GDOS or any other.)
There is never anything to be gained by omitting XBRA for vector bending.

As for being aware of the programs that might need it, there must be
loads of programs that neither you nor I have ever tested. There is
no chance ever of any single programmer being aware of all of them,
or their needs, so lack of such awareness has no relevance.

>> For such a case the fact that TOS will break the chain towards the
>> end of the boot sequence lacks importance, as the existence of the

>> chain up to that moment has already had its needed effect. There
>> are of course other more complex examples too, but this fairly
>> simple one should suffice.
>
>Actually you can inquire which version of GDOS is installed by calling
>trap #2 with a special opcode.

Certainly, but that was never my point. The need for XBRA seldom has
much to do with the program in which it is needed. It is there so as
to avoid interfering with the use other programs may need to make of
the XBRA chain.

Most TSR programs simply link in and then stay there until RESET, never
again accessing the chain except for the direct link used to jump through
the vector 'below' itself. Such simple usage does not even require XBRA
in itself, which is why some even think (mistakenly) that it is not needed.
But if those don't have XBRA, then the other programs that do need more
advanced use of XBRA chains are blocked, and can't do their work properly.
(Again, Julian, this info is mainly directed at others.)

----- snip ----- re: GDOS copyright issues

I think you and I agree on this, and for this case it does mean that,
unless we get contrary information from the AMC_GDOS copyright holder,
I can't spread my modified version at all.

>> I suppose it can be useful even without XBRA, although in a limited
>> way, as there are many situations where extra breaks in XBRA chains
>> will cause trouble.
>
>How about finally giving a real world example? Which auto folder
>program requires that the GDOS in use is using XBRA to change the GEM
>trap????

Come on. I have tried hundreds of programs that I never kept installed,
not because of any fault in them, but merely because they did not suit
my tastes. I do remember seeing these problems in some, but I am not
going to even try to dig them up again. That would be a waste of time.

You yourself know very well that broken XBRA chains can have this effect,
and though you believe that none of the programs using this vector would
suffer such problems, you also know that some might exist that do.

My whole point is that with XBRA present in GDOS as well, the risk of
any such problems will be reduced, that's all.

991. TT/CaTTamaran problems

Newsgroup: comp.sys.atari.st
Date: 1999-06-22 00:00:00 UTC
From: vuk-@geocities.com
Message-ID: <7kn2upnoa1@as102.tel.hr>
Source record: 76927

I have TT revision J, and CaTTamaran don't work in it.
Well, works 2-3 minutes, then crashes.

I think crashes is caused when TT trying to call bconstat (TRAP #13)
or event_multi. However, when I tried to use fan (I mean BIG fan,
fan for hair) those problems don't appear.

So: should I use some fan or I doing something wrong?

I have CPU on motherboard (right side) and in CaTTamaran docs it's named
as newer board, and I connected CaTTamaran properly.
TT had two wires extra, on chip 74AC244, one is connected to R888,
and another to R887, so I had to remove those one leads to R888, because
CaTTamaran use it.

Anyone can help me to make this CaTTamaran works ?

Vuk

SL 99 with the built in emulator does not use the Windows drives - at
least the demo that Invers just put up does not. Acessing the print
dialog pulls up the familiar driver (TOS) window with the Atari print
drivers listed. On my 350 mHz K6II (128megs) and a 4 meg graphics board, SL99 in
emulation mode feels about as fast (maybe a little faster) than SL 98
on my TT with a 64 bit Nova Card with 2 megs of memory.

Hi, ST friends,

just a few of questions about games for Atari ST.

Which (war) strategy games, round-type (like Panzer General) or
real-time (like Dune 2) was ever released for Atari ST ?????????
(btw: was Dune or Dune 2 released for ST also ?????)

Also, I know that Gobliins and Gobliins II was released for ST. But what
about Gobliins III ????? Was it released for ST also as for PC and Amiga
?

Let me know.....

Thanks,

Dalibor

There is no TOS version that doesn't allow partitions of at least 256
MByte. Even TOS 1.00 supports partitions with a capacity of 256 MByte.

997. Upgrades/hacks for the 520/1040 ST

Newsgroup: comp.sys.atari.st
Date: 1999-06-22 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <376F2E1E.781E@geocities.com>
Source record: 76933

I recently bought a computer for a former member of AUNT for a
reasonable price. Though it was a 1040St, I knew the computer had one
really nice thing about it... an AdSpeedST chip.

I bought it, used it for a while, and recently when deciding to change
out the floppy drives with one less flakey, I would then learn how
unique the computer was.

Opening up the computer revealed a snow scene of dust. The computer
looked ancient. There was a dual battery setup strapped to the
shielding with electrical tape, and the leads from the battery ran to
the underside of the keyboard.

"What the ...."

Looking inside the computer revealed a mess of wires. Examining the
underside of the keyboard, I found it was a "time saver". The batteries
were so old they had eaten through their battery case they were held in,
but luckily not beyond they packaging tape they were wrapped in.
I found the AdSpeedST chip... bit ole huge sucker. I was thinking of
putting it in another machine, but after seeing the wire mess from it, I
decided quickly against it.
Then there was the 4 meg upgrade.. another fine wirey mess.

I looked at the 1040ST, and then at the insides of a Mega ST 4 in
package condition... and fell in love with the 1040ST. :)

So, now I have this computer that has been hacked to hell, and already
has a decade of use (and I will probably use it for a while till I save
up for .. oh.. an Atari Milan?) :) ...

.... what I'm curious though is what other upgrades can I add to this
machine to make it an even more wirey hacked up mess?

I was thinking of doing the sony drive 1.44 upgrade, and I figured you
could add an internal hard drive. What else can be done?

Look in the KILLFILE supplied with Newsie for examples. Basically you just need to identify some unique string in the header and tell Newsie to direct such messages into a separate mailbox.

Right, you could do that. However, an IDE board must be attached to the
68K processor, which has probably already been hacked to hell, so I
wonder if you'll physically have room to do that. The HD floppy drive
modification should be ok, whether you get an AJAX chip depends on how
confident you want to be in your ST's future reliability. You can also
upgrade to TOS 2.06 (which is strongly advised anyway for an IDE board)

It's an earlier version, with a few less options, but quite powerful. It
might not have scoring capabilities, and I beleive the MIDI resolution
to be slightly lower.

> but i'm still gonna pick it up regardless.....this whole little edeavor is

2 Megs are fine for what you plan to do, and upgrading would mean
getting a 3rd party expansion board which would probably cost more than
you will want to pay for only 2Megs more. The ST series can only handle
4Megs anyway. 2 are plenty.

You don't want to upgrade the monitor. The monochrome monitor is the
best you can get. Colour screens give a lower resolution and are not
suited for serious work like MIDI stuff.

All of this, and how to connect a hard drive is widely explained in the
Quick FAQ.

I really have no documentation that states SB II accelerates any of
the Falcon clocks. So I really don't know. But it sure does
accelerate something.

If I get time, I'll try to run NemBench with the SB II and see if that
shows anything.

>(Interlace flicker frequency = half the refresh frequency.)

Let me ask you this, when you were using CentScreen with your CT2B
and changed from 640x480 into a resolution of around 800x600. Did
your desktop Icons for your drives and programs decrease in size?
Also, didn't the Standard Atari Font also decrease in size?
But you got a larger desktop area to work with.

When I do the above with my CT2B using Centscreen the font and desktop
icons decrease in size. And my desktop space is larger.

Now when using ScreenBlaster II when I would switch from 640x480 into
800x600 the font and Icon size was exactly the same as the ones in
640x480. Only the desktop size changed. I did get more room.
Only when I went into a resolution like 1280x960 did my
font and desktop Icon size decrease in size. Thats one reason I
didn't use 800x600 very much was due to the large Icon and Font
size. There is probably a way to change this with the SB II software
as it has lots of options, but thats the way it was with the default
setup.

Ok, From what I can tell from the resolution listing in the SB II
docs, SB II ran 800x600 in Non-interlaced mode. It could do this
in 16colors as well as 256colors. Both were very usable, but I did
noticed a bit of a slow down if 256colors were used in this mode.

However, it was still quite useable. And the main reason I did not
use that res was due to the large Font and Icon sizes. They
were just too large for my taste.

Apparently I've never seen 800x600 in interlaced mode with SB II.
According to the SB II resolution listing, 800x600 in 256colors is
done in 35 KHz Hor. and 55Hz Vert.

There are a couple more 800x600 resolutions with different Hor/Vert
settings to choose from. But none were in Interlaced mode IIRC.

I'll have to try Videlity and see if I like the results.

I sure have the stock microphone input/output connectors, but really
no Bass Boost that I am aware of. I have seen other Falcons audio
hardware and mine differs somewhat. The audio has always been clear,
free of any clicks or noise. I do quite abit of D2D recording.
I get nothing that I would consider as a Bass Boost in my recordings
with the Stock Falcon. But since then I added a Nemesis buffer which
put a resistor and inductor on the DMA, which changed the output
slightly. But not in a bad way.
Now with the CT2B installed this also has put a resistor
on the DMA, I've not fully tried all my Audio software yet to see
if this has made any differences.

Are you sure there is no hardware bug with the Modem port on the
Falcon?
What about the Modem port that isn't physically there?
And the Modem port really being Modem port 2. Wasn't this
due to a Hardware bug?

And software patchs where needed to fix this. That was always my
understanding of the problem.

I also use larger buffers in my HSmodem setup. If you can and don't
mind, e-mail me your DCC and SCC auto programs. I'll try them here
in standard mode and see what happens.

Good. I'm glad it does indeed work. Can you tell if there is
any kind of increase/decrease in speed. What I'm really asking
here is only regarding the blitter control and the software
thats used by both fVDI and NVDI that allows TOS 7.X to work.

>

Yes this is odd, Also I find that ExtenDos Gold reports a error when
booting in Turbo Modes. Drive not responding or something like that.
Not sure if this is due to Cecile or not?

However when Cecile Boots, it correctly access each hard drive and
the CDrom and CDR drives. It displays the correct name and info on
each one.

>
>HDDriver being 'Not set right', or possibly having been corrupted, is

Thats what has me confused here. I'm still going to get a shorter
Main SCSI cable and see if that makes any difference.
I have tried re-installing HD Driver and different settings.
None of this has helped.

>in debugging various things.

Thats what I thought, but wanted to check for sure, since I've tried just about everything I can think of trying to get it working with the SCSI drives in Turbo Modes.

Also wanted to ask about some settings with NVDI and the CT2B.
In either TOS 4.X Turbo or TOS 7.X Turbo, What would you recommend the settings be in the NVDI Compatibility CPX for things like Tos Compatibility and Line-A. Should these be checked with the 'X' or not?

And in the System information CPX, should the Cache and 16Mhz be checked with the 'X' or not?

Thanks for your help,

->
->THeo
->
->.

This has got to be one of my personal pet peeves. Why Woller won't
appoint a US distributor for N.aes is beyond me. N.aes is one of the
essential ingrediants to a solid working MiNT setup, and US users
are being denied it. Kent at Systems For Tomorrow has stated that
he has been trying to get it for a long time now.

Its no wonder that MagiC's popularity, both among users and developers
is growing. Are you listening Woller? Wake up!!! ;-|

Can't help you with the TOS-in-a-window question, sorry...

>Actually, those drivers don't contain any blitting code, AFAICR
>(I'll check it when I get home).

I have now checked the NVDIDRV4.SYS and NVDIDRV8.SYS files and neither
contains any blit code.

However, I did find blit code in the OFF*.NOD/ODS files, so I guess
NVDI doesn't have it built in after all.
(It's strange that I never thought about those files before.
This certainly explains why I couldn't get NVDI to work under PaCifiST...)

Anyway, if someone were willing to hack around a bit, it might just
be possible to do a software blitter by calling the appropriate
routines in the correct NOD/ODS file.

Going back to what I said, I tried an experiment today, and found
that running under MagiC a ZIP file containing long filenames brought
MagiC crashing down whilst trying to extract using STZIP. Swopping to
TOS everything worked okay, although, obviously, the file names were
shortened to 8+3. I'll carry on playing!

;-)

Kind regards

I should have said "which media are supported?" such as CD, CD-R,
CD-RW, DVD-ROM, DVD-RAM etc. I was curious which of the newer
media where usable on the Atari. From your comments, I gather that
HDDriver provides the low level support for most of the media in
either IDE or SCSI versions and extra high-level drivers are needed
for the -ROM media.

Spin and ExtenDOS support CD-ROM but it there any support yet for
DVD-ROM yet ?

>> Any chance of adding Firewire support??
>
>You have such a device connected to your Atari?

No, not yet ;-) I would like to put a Firewire card into my Milan
and be able to access my Digital video camera. I have been reading
about Firewire on the Apple, Adaptec and Sederta web sites. These
companies all produce firewire cards but they only have drivers for
PC and Macs. Sederta offer a software development kit but it is quite
expensive.

regards,

Peter.

Hi Mike,

Well NVDI is installed now. Works well but still hope something
else will come about.
BTW here is the results of NemBench.
This was done in 640x480x2 in Tos 7.04 Turbo Mode.
No FPU installed at the moment. Soon. ;)

NemBench v2.1 - precision CPU/FPU profiler.

Integer multiply (16bit) -> 1.921 Mips (~313%)
Integer divide (16bit) -> 1.135 Mips (~313%)
Linear (stalled) integer -> 24.975 Mips (~313%)
Interleaved (piped) integer -> 24.975 Mips (~313%)

16bit read (100% hit) -> 24.630 MByte/sec (~313%)
16bit write (100% hit) -> 20.161 MByte/sec (~335%)
32bit read (100% hit) -> 49.261 MByte/sec (~313%)
32bit write (100% hit) -> 40.322 MByte/sec (~604%)

Linear 32bit read (ST-Ram) -> 10.224 MByte/sec (~192%)
Linear 32bit write (ST-Ram) -> 11.477 MByte/sec (~177%)
Linear 32bit copy (ST-Ram) -> 5.728 MByte/sec (~177%)

Linear 32bit read (FastRAM) -> 32.483 MByte/sec (~611%)
Linear 32bit write (FastRAM) -> 38.721 MByte/sec (~600%)
Linear 32bit copy (FastRAM) -> 13.855 MByte/sec (~429%)

How do these results look?

Are there any other programs like NemBench I can use to
see what I've got with the CT2B?

Hi all.

I found something on the web for my Atari and downloaded it to my mac. It's stuffed in the standerd mac way but it won't allow me to decompress it in order to put on a Dos floppy for transfer to get it to my 140 ST.

Any suggestions ?

Be well,

-arik-

On Thu 24-06-1999 00:26, Joe M. Villarreal TOS'd the following:

>You'll need to clear the RAM cache whenever it gets close to full. I have it
>set to 9 megs at the moment, but I've tried different settings. I always
>clear the RAM cache whenever graphics from a previous page start to load from
>disk instead of the cache.

I understand that, but it happens when I first start CAB and I'm
using a 6 meg RAM cache. For example, I can go to www.reel.com
as soon as I load CAB (which I often do). It uses many of the same
graphics on every single page, yet CAB 2.7 always insists on loading
them from disk, even the background image that never changes. Even
if I reload the same page using ^L or Alt-B from the next page, it
still reloads all the graphics.

That's not to say it doesn't ever use the RAM cache. It does, but
not nearly as much as it should. Not even close to 50% of the time
it can, I'd say. And I won't even get into the way it uses RAM,
which quickly leads to memory so fragmented, my 6 meg cache is
virtually useless after awhile (of course 2.5 was no better in that
area).

Needless to say, I find the RAM cache implementation by far the most
annoying thing about CAB 2.7. The thing is slow enough loading
graphics and formatting pages without repeating tasks it doesn't need
to. Makes me wonder who was doing the beta testing.

> like toluene or acetone?

Yes. But avoid things like toluene or acetone which are too vigorous for normal cleaning.

I have done a number of refurbish jobs and have found that kitchen surface cleaners are ideal. Here in the UK they are called "Mr. Muscle" or "Jif" but, basically they are a laminates cleaners which usually comes in a spray pack. These cleaners will strip off most of the rubbish - if there are any patches of dirt remaining just go over them again applying local rubbing pressure. They will leave the surfaces very clean and, thus, susceptible to staining/sweat marks so, as soon as the surface is dry, after rinsing in clean water, spray with a silicone based polish. This will protect the surface against further marking.

Naturally, it is best to do this job with the machine totally stripped down so that you are only processing the plastic and can stop worrying about the PCBs etc.

>8bit resolutions are the most useful ones Videl can offer.

I had an AB040 for quite a while before getting my Eclipse and I didn't
use the 8 bit modes, anyway.
Naturally, the processor wan't burdened by the grahics mode, but all
screen operations took 'ages'. I couldn't live with two times slower
screen updates, but it depends on what you're doing of course.

With the fVDI shadow buffer things would be a lot better on an AB040
(no reads from ST-RAM). It's very noticeable in 16 colour mode.

>>and in 16 bit there were no usable resolutions.
>
>That has little to do with NVDI itself, since it is not a resolution

Of course not.

I've played around a good deal with my BlowUP Hard II, though, and the
only decent 16 bit mode I could get was 480x480 (this is on a standard
30kHz and up multisync monitor, and only counting non-interlace modes).

>I would not call either 768x576 or 640x480 useless, and though some may

But neither of those modes is available on a setup such as mine.
You need at the very least a Nemesis or a 15kHz monitor.

>>If you want reasonable graphics in windows, I guess 16 colours are
>>stretching the limits, even at high resolution. That's one of the
...
>I can understand that. I haven't worked much on real dithering, but I do

You can get very good image quality with 16 colours in high resolution,
but you have to be able to select those 16 colours yourself.

>>Well, while you're waiting for the Eclipse to be released (should be
>>any week now), perhaps you could write an eight bitplane fVDI driver? ;-)
>
>I am seriously considering it, but it is a matter of getting into your

:-)

>way of doing things, with a minimum of docs. I was disappointed to find
>only source code for graphics cards on your site. It would be much more

There is no source code for graphics cards there, since I'm not sure
yet if those can be released (NDA's).
The example 16 bit driver is entirely software based (and very old).

>useful to have the 4bit VIDEL driver as an example, as that is a more
>familiar resolution to me.

Since fVDI is (or rather will be) under the GPL, you can have the entire
source tree (except the mach64 driver, for now) if you like.

>I have now made some rather extensive tests of fVDI with the 4bit VIDEL driver.

:-)

>
>My intention was of course to test the 1bit driver too, but I never got it to
>work. fVDI never did switch to a monochrome resolution, but stayed physically

No, currently fVDI always stays in the resolution you started it in.

As I said in an earlier article (not in this thread), it's easiest to
test fVDI by starting it from the desktop and then you can of course
be in whatever graphics mode you like.

>At first I experienced bombs on every boot, not when fVDI started, but a bit

A little while ago there was a note in the documentation saying that
booting wasn't really supported in the normal Atari modes. I think I've
removed most of that text now, though, since it seemed to work last time
I tested it.

Again, testing of fVDI really should be done from the desktop, unless
you want to run below NVDI.

>later when it was time to launch desktop. I managed to 'backtrace' the code
>to the triggering function calls, and noted that these where a pair of calls
>like v_show_c(1,1) and v_show_c(1,0). This appears to be how desktop does
>activate the mouse cursor after the rezswitch is completed.

Ah!

It's, unfortunately, really troublesome booting under a debugger on the
AB040. I've only found a single debugger that can do it at all, and then
only without caches and FastRAM. It still usually crashes in some strange
way before I'm finished with what I'm doing.

>The strange part of this was that the code bombed because the mouse draw
>routine attempted to store pixel data at address $00E1C744, which is in the
>TOS ROM area !!! But investigation soon showed that this was only because
>that area does come immediately after the normal screen area.
>
>Surely this must have happened occasionally on your system too !?!

I've only booted in the bitplane modes once or twice since that mouse
code went in. Apparently I was lucky.

>Unless the AB hides it, like the CT2 would in TOS 4.x mode, if I had not

Due to the way the mouse routines currently work, even the non-movement
functions have to supply a coordinate. They do this by fetching from the
main workstation struct, which normally is perfectly fine (it is updated
when the mouse movement vector is executed).
Unfortunately, I forgot to set an initial value on startup. :-I

>The problem appears to be that the mouse handler part of your driver does not
>initialize the mouse coordinates. On further reboots I managed to trace into

The bitplane mouse routines are very new...

>your mouse drawing code, and saw how it fetched a Y-coordinate of 845 and did
>use this value without checks or limitations to calculate the pixel address.

Ooops!

No checks are really needed since the mouse is limited to the coordinates
found among the LineA variables.
Naturally, that doesn't cover a redraw before the first move, though...

>better, and that needs to be done at each rez change, as even after an

fVDI doesn't know about resolution changes at all yet. Mainly because
it can still only load one driver.

>I used the 'triple switch' method to activate the old mouse drivers of TOS,

Until very recently that was the only way.

>so that it is now verified that fVDI can do this job for a CT2-Falcon.

:-)

>When used with NVDI, however, that appeared to take over the font handling

Yes, that is the main thing NVDI does for screen drivers when it's 'on top'.
The fonts are rendered into a monochrome buffer which is then passed
to fVDI for mono-expand blitting.

This is very fortunate since it would otherwise be impossible (or at least
very difficult) to use the NVDI vector font support on graphics cards.

>completely, and when used 'below' NVDI I am not even certain that any of
>the fVDI code was still in use. I had no indication of it anyway. With

When fVDI is 'above' NVDI, it doesn't let the latter do much at all.
Currently it passes the palette handling and in your case the mouse through.

With fVDI 'below', it can indeed be a bit difficult to see anything,
but you will currently, for example, not get any filled circles, there
will only be solid lines and in 16 colour mode the text and icons will be
monochrome. If any of those things look normal, you didn't set things
up correctly. ;-)

>I tried combining fVDI with Videlity, trying them in both of the possible
>relative positions, and neither worked properly. Apparently fVDI does not
>allow more than a single resolution per driver, unlike NVDI, for fVDI now
>drew 'two desktops side by side' in the bottom quarter of the screen.

That is not the problem. fVDI is perfectly happy with any resolution.
However, I've not yet spent the time figuring out when those resolution
enhancers actually do their thing and/or what to do about it.
fVDI simply assumes that the mode set when it's started is the one that
will be used when the workstation is opened.
It would probably be enough to check the LineA variable at the v_opnwk,
but for that to do any good fVDI would have to be able to deal with more
than one device driver.

>As Videlity had set 1280x960x4bit that bottom quarter is exactly what would
>have been the proper screen area in a resolution of 640x480x4bit, which thus

I'm not sure I've _ever_ run fVDI in 640x480x4bit.
My normal 1008x608 is just fine, as is any other mode (as long as it is
selected before fVDI starts).

>I don't see why the driver can't adapt to the real screen base and size as
>set up by Videlity. There are plenty of other drivers around that can do so.

If Videlity had changed the mode before fVDI was started, as is the case
when you run fVDI from the desktop, this will work perfectly fine.

Naturally, I will add the little LineA check sooner or later (if noone
else beats me to it ;-).

Many thanks for the comments, not to mention finding that bug! ;-)

>faster.

Of course it will, as NVDI has much faster routines than normal VDI has,
but that does not answer the question of whether or not SB itself does
accelerate any of the Falcon clocks, except for the pixel clock. And,
of course, just speeding up a pixel clock will actually make the system
slower when that pixel rate is used.

>I do think the hardware does provide a increase or boost so the rest
>of the system is not slowed down if higher resolutions.
>I see no point of the hardware if it didn't. As you point out
>there are software only solutions to get higher resolutions.

Right. And yet that is exactly what some sources are saying. That some
of the hardware resolution expanders affect only the pixel clocks.
I have no direct experience of such hardware myself, but I would
definitely advice anyone not to invest in such a resolution expander
without first checking how it will affect ST-RAM access for the CPU.
Why pay good money to get a slower system ?

>Most of the default VGA/SVGA resolutions seem to not be in interlaced

>as small as one might expect.
>Most of the software only solutions I have seen put 800x600 in a
>interlaced mode, thus decreasing the desktop Icon size.

I have no idea what you are talking about here...

A good multisync monitor should produce exactly the same screen scaling
for 800x600 uninterlaced VGA as for 800x600 interlaced PAL signals, and
that means that all objects should be identical in size. The only real
difference is that the latter mode would flicker quite a lot, due to the
interlace effect at this relatively low screen refresh rate.

(Interlace flicker frequency = half the refresh frequency.)

>Is it possible with software only to get 800x600 in 256colors
>in a standard resolution not using Interlace?

Yes, that is possible, using the undivided 32 MHz pixel clock, since
800 such pixels use the same time as 625 pixels at 25 MHz pixel clock.
Thus line format fits in a standard VGA line. The increased number
of lines (as compared to 640x480) will lower the vertical rate to appx
48 Hz, but that can be compensated for by cutting the line length a bit,
to achieve a vertical rate of 50 Hz, which should be enough for such an
uninterlaced mode. (Flickers less than 100Hz interlaced.)

But getting the system as a whole to run with this is another story,
as such massive VIDEL loading is bound to make the system very slow.
Hmmm, I think I'll make some small experiments here...
----- some small experiments later -----
Yes, the Falcon can run such a resolution even in unspeeded mode, but
ST-RAM access speed is down to 50% of the Nembench reference value,
so the system is very slow. If the cache is disabled even very simple
operations, such as moving mouse into a menu, can cause lockup.

I recommend using the same resolution with interlace instead, and with
somewhat lenghtened blanking intervals, both horizontally and vertically.
This way a very low-flicker interlaced 800x608 can be achieved, with a
half-frame frequency of appx 75 Hz. Blanking intervals do not cause any
VIDEL load at all, so adding some 'blank' time on each line decreases the
risk of CPU lockup due to inability to service time-critical interrupts.
Adding whole blanking lines also gives CPU full access to ST-RAM in those
lines (unless SDMA needs it), thus reducing total VIDEL load even further.

>I did find it a bit hard to configure new resolutions with SB II.
>But the hardware/software supports just about any type of monitor
>even RGB.

All screen enhancers for Falcon should support all its monitor types,
and all the ones I have used do so. Videlity is the one with the best
user interface, and it has very good consistency in how it reacts to
changes made. Neither Videl Inside nor CentScreen can compete with
it on that front.

>>That sounds very odd to me. I never had such problems. At very high

The 'sickness' may not have been due to hardware, but could also be
due to some unsuitable software, or some bad configuration settings.

>Also have heard from some Falcon owners who could go higher than
>57600 without any modifications.

That honestly should be considered the normal case. Those who can't
should continue looking for the reason why.

>My Falcon has always had a Excellent Sound System without any
>modifications. I get excellent results with D2D recording.
>No Clicks or BassBoost in the Audio.

An original Atari Falcon always has the bass boost, as well as the
silly microphone level inputs. That is not something that can vary
'of itself', but requires exchange of components to be fixed. C-Lab
as well as some retailers do that for all machines to be sold. That
is why there can be such differencies even for new machines, as some
retailers simply sell them in unmodified state.

>Also everything else has
>worked great with this Falcon. I just happen to have one that
>did not like 57600 in normal VGA resolutions.
>There may be slightly different Falcons produced that had abit
>slower modem port speed.

No that is impossible. The speed is crystal controlled, and any
deviation at high rates would lead to the same percentual deviation
at lower frequencies too. Such a machine could not function reliably
for serial communication with any other machine as all speeds would
be equally mismatched.

>AFAIK, the modem port on all Falcons are buggie, We have always
>need software patchs such as HSmodem to do higher port speeds.

That has always been due to unoptimized programming in TOS,
so that is not a hardware issue.

>So it could be that my HSmodem settings aren't what they should
>be in order to do 57600 or higher with the stock software.

Now you're talking my language again... ;-)
Yes, in many cases this is the sort of thing to look for.
And since most users only have one computer, the other critical
component in their serial connections is the modem itself.
It too must be set up correctly for efficient handshaking.

>Now with the CT2B installed I can easily do a port speed of
>230400. I bet it would go even higher if possible.
>This just goes to show how good this CT2B I have is.

Any good accelerator should have this effect, though the exact
degree varies with acceleration speed.

----- snip ----- re: more on differencies between our pre-CT2 systems
>
>Can you use 640x480 in interlaced Mode? If so I did not know that
>was possible. I thought that 640x480 was a standard non-interlaced

>resolution.

Any logical resolution can be implemented through a multitude of
differently timed video signal setups. The normal VGA standard
for 640x480 resolution is uninterlaced, but that is no reason
not to implement an interlaced signal for the same resolution.

It will then no longer use the standard VGA timing, but may still
suit a multisync monitor, or even a PAL monitor or TV. For the
latter types interlace is actually required for any resolution
which is that high. (Their uninterlaced limit is appx 300 lines)

>I have asked many times in the past about getting 57600 or higher
>in stock standard 640x480 or higher. Most said that I needed a
>accelerator to do this.

For 640x480x4 bits...? Then they spoke nonsense !
Or perhaps they misunderstood and meant for 16bit Hicolour mode.
For that they are correct (except for interlaced PAL/TV modes).

>Again the problem with the port speed at 640x480 with the stock
>Falcon could be due to HSmodem settings not as good as they should
>be.

Indeed, or problems with setting RTS/CTS in CPXs, or problems setting
up the modems to be used.

>If you have a HSmodem configuration that will do 57600 or better
>in 640x480 or higher resolutions on a standard Falcon. Then I'd
>like to try it here and see if indeed my Falcon will do this.

I can send them to you if you wish, but it is not certain that they
will match how you wish to use the ports. One difference you may try
at once is to ensure that your buffers are big enough to let ports
have a big margin for handshake responses. I always set reception
buffers to a size of 16384 bytes (==16K), and transmission buffers
to a size of 4096 bytes (==4K). This ensures that even long delays
in handshake checks allows RTS/CTS to halt a data stream without any
buffer overflow, and also allows Midi and Modem 1 to function fairly
well without any handshaking. They may lose some packets, but TCP
protocol can deal with that automatically.

Posting the modules publicly is not an option, as that would be a form
of split distribution of the HSModem package contrary to Harun's wishes.

>Can you get a working port speed of 230400 with you CT2B?
>
I think so, but it is hard to test such things properly. My TT030 is
not fast enough to test this thouroughly.

>I do understand that more is needed than to just turn off the
>Blitter. I would like to have a program that does what NVDI
>does to allow the CT2B to work correctly with TOS 7.X without
>all the other features of NVDI. If such a program was made, I

>give even better results than NVDI. And if I want or need the
>other features of NVDI then fine, that would be another option
>since it works correctly, at least thats what I've been told.

It is true. NVDI does solve the problem, and it is only parts
of it that are needed. But those parts are not collected in one
program, as NVDI uses loadable drivers for various bitplane modes.

>I don't mean to Knock NVDI, I have used it before. I just
>don't like the idea of having to install a program such as
>NVDI just to use one of its functions. Even though it is a
>important function. I like options and more than one way
>of doing things. Thats why I enjoy using Atari machines.
>I'm sure lots of folks use NVDI and all of its features
>and find it very useful. Personally at the moment, I'd
>rather have another program for the CT2B TOS 7.X mode.

I quite agree. Even though I do intend to use NVDI in all my
normal boot setups, I also want to have 'close to clean' boot
setups for testing purposes, and then it is not appropriate to
boot NVDI's 'super-GDOS' with speedofonts, truetypefonts, etc.
That is one of the reasons I am interested in using both NVDI
and fVDI, as the latter may give the ability to use 'cleaner'
test setups (but it is still in an early development stage).

>fVDI may also work, thats something I will try as I go
>along. But I need access to all color modes, Including
>256colors.

I can confirm that fVDI does work with CT2, but support for
most bitplane modes is still missing, and that includes the
8bit mode which is required for 256 colours.

>ok, I didn't word it right then. A simple program or patch that
>controls the Blitter and replaces the Blitter with software
>routines that do the same job, as well as to insure that the
>Blitter is not turned on again. For use with a CT2B in TOS 7.X

Quite correct. That is what I call a 'software blitter', and it
has existed in all Atari TOS before the Falcon. I have urged Centek
to make one, instead of relying on other software, but instead the
patches they make simply try to skip past many operations that do
use the blitter. Thus their code consciously avoids many blitter
jobs, rather than trying to implement them in software.

----- snip ----- re: Cecile works for your SCSI drives, but not HDDriver ?!?

That is a bit odd. Here I never got any use out of Cecile that I
could not also get out of HDDriver 7.51 . And Cecile completely
lacks the generic SCSI driver that HDDriver has, which is needed
by some of the CD-ROM BOS drivers for BetaDOS (or MetaDOS).

>Since most of the documentation of Cecile is in French, I was uneasy
>about installing it. I should have did this days ago. I knew it
>was something simple. Apparently something in HD Driver is either not
>set right or it is not compatible with my CT2B board.

HDDriver being 'Not set right', or possibly having been corrupted, is
what I guess at. I have seen no trace of any problem I can blame
HDDriver itself for. It appears fully compatible to CT2 here.

>Cecile has a nice configuration setup that is in English however.
>I've not tried the Fastest ATA IDE settings yet, but will soon.
>
>Now what I really need is some English docs on Cecile or any info
>about it.

Be prepared to wait...
Most Centek staff are not very good at english.
I can't help you either, as I don't use Cecile myself.

>I'm not sure if there is any main board differences. But everyone
>said that HD Driver would work in Turbo Modes. It sure will not here.
>I've tried about everything I know of trying to get it to.
>Do you have HD Driver.SYS in the root directory or the Auto Folder?

HDDRIVER.SYS can only work in the harddisk root directory, and it should
not just be placed there by normal copying, as that does not ensure that
the bootsector needed to load it properly is also installed. This should
only be installed (or removed) by HDDRUTIL.

The only case when you should ever boot HDDRIVER from an AUTO folder, is
when you boot it from a diskette, and then the proper filename is not
HDDRIVER.SYS, but HDDRIVER.PRG, as that is required for AUTO programs.
Normally this is only done when first installing HDDriver on a new
harddisk, or to recover from disk crashes, though I also sometimes do it
in debugging various things.

What usually causes UVK 2000 to not work on a system is the system status screen. If you keep one of the SHIFT keys pressed during program load, until the main menu appears, you're safe. I don't recall which SHIFT key it is. Try either.

I'll do that.

I did a bit more testing and now have it working so well from 2 - 720k floppies (1 for STinG 1.20 and 1 for CAB 1.5), that's it's scary. AND with full graphics!

Using graphics enabled, you need to flush your disk cache every 5 pages on average; with graphics disabled, it would be every 15 - 20 pages unless they are massively sized pages.

I'll post a URL for the instructions when they're done. They'll also be free to post on any other site in the event our site is down or hard to reach.

Make sure that you have all files from the previous version of Sting
removed before installing 1.20. Ronald mentioned that the program
implements TCP/IP differently than the earlier versions and are totally
incompatible with each other. Delete all the older files are start with a
clean install. Sting 1.20 works great.

Where the floppies formated with the ST ?
If so format some floppies, on the Mac or a PC and then (if you still have your st) copy your disk to the newly formated floppies.

This is in the Quick FAQ.

You can't, because of the Atari's parallel port lacking some signals.
You need a SCSI Zip drive and a SCSI host adapter.

Check out the Quick FAQ.

The ST uses a standard called ACSI, which is not directly compatible
with SCSI. To use a SCSI drive, you need to use a SCSI host adapter
between the ST and the drive. These can be bought from Atari dealers.

> Regards, /Peter/

Well, originally, CAB was designed as an off line browser. This is why it needs a cache, and why it does not interface directly with STinG. It is the CAB.OVL's job to use the TCP/IP stack to retrieve the files and store them in CAB's cache so that they can be displayed. The OVL also does all the authentification stuff if required.

If the disks have been formatted in 720K (double sided, double density)
mode from a TOS version above 1.04, then they should be directly
readable with PC Exchange. If not, then you'll need to go back to an ST
to transfer the files onto DOS 720K disks.

Yes, I will do that tomorrow. It's just that everytime I boot up for the first time that day, I seem to forget to do my "CAB testing", and boot with Nemesis and run CAB. And as I've said, once I run CAB the first time, and it freezes, I can't make it do it again until the Falcon has been off for a while.

And yes I know about turning NEMESIS on/off with software ;^)

Thanks,

-Paul

I also use NEWSie, occasionally aFTP or MGFTP, and I've used POPGEM every once
in a while.

>Several factors are common to both:
>
>1: Basic STinG configuration, mainly through DEFAULT.CFG, the CPXs, and
> through the DIAL.SCR . You may need to check these for any mistakes
> made or settings forgotten in switching to STinG 1.20 .

Well, if it was an error that happened ALL THE TIME, I would probably agree
with you, but it happens randomly (particularly with the POPwatch "timeouts"),
and for no apparent reason. It'll be fine for several days, then timeout like
crazy, then be normal the next day - all without me changing ANYTHING.

>2: DNS operations, which depend on a legal NAMESERVER, either from the
> DEFAULT.CFG or from DIAL.SCR, or even through PPP login directly from
> your ISP. Check settings against your account info.

I haven't changed these since setting them up, and I don't see them as being
the problem since 95% of the time, everything works great.

>3: DNS cache file. A corrupt one can have strange effects, and the best
> cure then is simply to erase CACHE.DNS and reboot. That will cause a
> message about the file being missing when STinG boots RESOLVE.STX, but
> a new CACHE.DNS will be created automatically.

Yes, I've had problems with the DNS cache before (particularly when I was still
using STinG 1.15), and I've done just what you said. However, this problem has
more or less gone away since I switched to STinG 1.20, and is therefore not
likely related to my POPwatch timeout problem.

Sometimes the timout is so quick that _I KNOW_ POPwatch hasn't even connected
yet. Basically, I'm connected with STinG, I load POPwatch, then click on
"connect" [in POPwatch] - and about 1/4 of a second after clicking, I get the
"-0015 user timeout expired" message. Sometimes it will happen as it's in the
process of connecting, sometimes in the middle of downloading an e-mail. All
randomly and intermittently. : -(

At that point I just use NEWSie to download my e-mail (which unfortunately, is
much slower). It can be very frustrating...

>First word:
>CAB, equal witch release, runs fine on any atari hardware.
>I tested by my self: 520ST 4Meg, Nemesised Falcon, CT2 Falcon.
>All modes, or on naked hardware.

Yes, I've run CAB 2.5, and now 2.7 (both under STinG) and they've worked great 95% of the time.

>CAB must have access to his cache well, anytime. All pathes true?
>Othersides, your problem sounds like CAB.OVL doasn't connected to STinG.
>(The point of CAB freeze the machine)

All paths and settings are correct - and haven't changed. And the OVL isn't the problem, since everything works 95% of the time just fine. I only get the freeze up if it's the _very first time I load a page in CAB after turning on the Falcon_. CAB will connect to the host, begin loading the page, then about 10-20 seconds into it, BOOM! - frozen.

But as I said, once it freezes, and I reboot, I can use CAB without any problems for the rest of the day. It's almost as if CAB were a sleeping person, and when you first wake him up for the day, he's a little "out of it", and starts doing his work, but suddenly falls back to sleep. Then, you give him the "boot", and he wakes up again, and says "OH! Sorry about that, I guess I fell back to sleep, but I'm up now, so let's go!" (and then he performs his job just great without complaining or falling back to sleep for the rest of the "day").

*I know, it's kind of a silly analogy, but I think you see what I mean. : -)

>I don't know what it is. Can't see your installation :)
>Do you use an http proxy?
>Try to delete this setting.

No proxy. And I know it's not a problem with the settings, because after it freezes the one time, and I reboot, it works 100% ok.

>Reboot the machine, remove all other things. Try again only with StinG,
>CAB and all what you need for web access.

I'll try this.

>How is CAB cache? External SCSI device?
>That's ok and must bee work in the same way as internal IDE.
>If not, do you have DMA/SCSI trouble?

Yes, CAB cache is on an external SCSI partition. And the freezing up I'm
talking about is NOT the same type of freeze up caused by the Falcon SCSI bug
(where the HD "busy light" stays lit). This is just the software itself
locking up, the drives are not involved.

>Try in low mode, try again with nemesis OFF
>With nemesis OFF you must have a simple Falcons, same as without
>nemesis. If the problem also appears, have a look to your software
>installation. (I think that's it)

Yes, I will do that - but I have to wait until the Falcon has been turned off
for a while to try.

>Phone is fucking expensiv in germany.. ;/

I'm sorry to hear that! Here in California (USA) the call to my ISP is local,
and therefore free (with the exception of the small amount I pay each month for
the basic phone service). I guess we're pretty lucky over here when it comes
to phone costs (and gasoline!).

Thanks for your help.

That's easy to check. Just run Nembench, GEMbench or something like that
in one of the normal graphics modes and see if you get better than 100%.

It isn't likely that an accelerator only speeds up the system when you're
using a higher pixel clock. That would be silly in the extreme.

>>I see no point of the hardware if it didn't. As you point out
>>there are software only solutions to get higher resolutions.
>
>Right. And yet that is exactly what some sources are saying. That some
>of the hardware resolution expanders affect only the pixel clocks.

Anything that is external, such as the BlowUP enhancer is limited to
changing the pixel clock. They _can't_ do anything to the bus.

I don't recall what the ScreenBlaster does.

>I have no direct experience of such hardware myself, but I would
>definitely advice anyone not to invest in such a resolution expander
>without first checking how it will affect ST-RAM access for the CPU.

It's obvious that ST-RAM access will be slower if you increase the video
load on an unmodified bus.

>Why pay good money to get a slower system ?

Because it's less money?
Because it's much easier to install?
Because it's more likely to work well?
(It seems most machines are fine at 20/40MHz or even 25/50MHz, but that's
not something that is guaranteed. If it had been, Atari would of course
have used a higher clock speed in the first place.)

>and all the ones I have used do so. Videlity is the one with the best
>user interface, and it has very good consistency in how it reacts to
>changes made. Neither Videl Inside nor CentScreen can compete with

I haven't used any of the above, but the BlowUP interface is fine with me.
I can modify any of the parameters at will while watching the effects it

has on the screen. There are frequency readouts and a 'panic' button.

>>I do understand that more is needed than to just turn off the
>>Blitter. I would like to have a program that does what NVDI
...
>It is true. NVDI does solve the problem, and it is only parts
>of it that are needed. But those parts are not collected in one
>program, as NVDI uses loadable drivers for various bitplane modes.

Actually, those drivers don't contain any blitting code, AFAICR
(I'll check it when I get home).

>and fVDI, as the latter may give the ability to use 'cleaner'
>test setups (but it is still in an early development stage).

It's not at an early stage. As I explained in my other message, most of
your problems have very simple reasons.
Just about every single program I've tried works with the bitplane
drivers, and on the Eclipse/RageII too as long as they don't try to do
direct screen accesses.

A few features are still missing, but filled circles/ellipses/pies, thick
lines and Bezier curves are coming soon.

>I can confirm that fVDI does work with CT2, but support for
>most bitplane modes is still missing, and that includes the

fVDI currently has accelerated support for exactly half of all possible
bitplane modes - monochrome and 16 colours. Different resolutions aren't
a problem, only how and when they are set up (as explained elsewhere).

One of the earliest releases actually had 2/8 bit drivers as well, but
those only accelerated lines and pixel set/get. That makes them too slow
for anything but experimenting, so for the time being I've removed them.

Cutting down the 4 plane driver to create a 2 plane one would of course
be rather easy. I've never used that graphics mode on my Falcon, though,
so it hasn't been a priority. Extending to 8 planes would take a bit
more work.

>>ok, I didn't word it right then. A simple program or patch that
>>controls the Blitter and replaces the Blitter with software
...
>Quite correct. That is what I call a 'software blitter', and it
>has existed in all Atari TOS before the Falcon. I have urged Centek

Yes, but then the system knew about it. If all the relevant VDI functions
actually call LineA you might get away with redirecting that, but if
the VDI has 'integrated' blitter support you'd have some major problems.

You're welcome to use the fVDI code as the basis for a software LineA
blitter if you like.

There are only 5 HTML pages, so it shouldn't be too hard. You can also
get a plain ASCII version from :
ftp://ftp.sol.no/users/h/hallvart/atari/info/quickfaq.txt

Hi there old computer-lovers!

I have a rather general question, so I post it in several newsgroups!
I am a collector of old machines, and recently I obtained some old
commodores,
including a 128D. Sadly, the plastic case of this machine has turned yellow
as a Brazillian banana.

Is there any way to clean or polish this color away with e.g. a solvent
like toluene or acetone?

Let me know!

Martijn.

> government over its citizens as long as they do remain citizens. But
there
> are definite territorial limits to what that government is allowed to do
as
> long as the citizen stays in foreign territory.

I think I know what you mean, but it's not what I was talking about.
Property laws and rights do not affect you abroad, and the jurisdiction is
constrained in territorial sense. Each county (l�n) has it's judicial
hierarchy etc. But all this is off the topic...

> That is a possibility, but doing that right would be too bloody complex.
> I would never feel satisfied with such a patchwork, so I am not motivated

On MiNT 1.15, either unpack to the new FN ramdisk or to VFAT.
It works rather well and handles long filenames.

Fast ram has been around for the Falcon for quite a while now (since 1992).
It has, and likely will, always require the use of NVDI because of the blitter. As no one has fixed this problem in this amount of time, it likely won't be. If you run your Falcon with fast ram installed, and do not use NVDI, your asking for trouble, and I don't mean just crashes. No buffer mod in the world will save your SCSI data.

Are you using Newsie, and if so, are you sharing the cache folder
between it and CAB? Try putting the CAB cache folder on a different
partition than the Newsie work and cache folder for a while and see if
your problems go away.

1071. North American N.AES dealers?

Newsgroup: comp.sys.atari.st
Date: 1999-06-23 00:00:00 UTC
From: thopmanNOSPAM@uoguelph.ca
Message-ID: <7kqqhg$jn9$1@testinfo.uoguelph.ca>
Source record: 76881

Title says it all, really. Are there any dealers in North America who carry N.AES? I'm getting tired of some aspects of Geneva, and N.AES seems to be the best non-Magic solution.

In the short term, can anyone recommend a decent Tos-in-a-window solution that a) multitasks (so don't say TOS2GEM) and b) doesn't require MiNT and c) works with Geneva? GenevaTOS is irritatingly slow, and missing essential features like (easy) clipboard support. I might be willing to forgo requirement b, since Geneva is half-decently fast under MiNT, but TosWin2 requires AES 4.1 (why, I don't know...), so I can't use the best Tos-in-a-window program I've found.

I use acetone for melting Atari plastic to liquid form, this is useful for fixing screw holes that have become too big. But I wouldn't recommend it for the purpose you want. The plastic would get dissolved and that's not what you want.

If I understand it right the yellowing of your case is due to the sunrays that have hit it during the years. Believe it's the same process that affects newspaper and magazine paper to turn yellowish. Nothing you can do about it.

Collectors of comic magazines put their magazines into black plastic pockets to avoid this effect.

> According to the docs, the SB II software was written by the authors
> of NVDI. And if you use SB II with NVDI then SB II will be even
> faster.

Yes, but that have nothing to do with the authors..
NVDI blast some routines (VDI ec.) thatï¿½s all :)

Same with SB3, Videlity or CENTScreen or what ever more.

> Is it possible with software only to get 800x600 in 256colors
> in a standard resolution not using Interlace?

I think no, a higher pixel clock is needet..
Needs an external software driven pixel clock oscillator.
(SB2, SB3) CT2 Board with.., or FX-Board with..

> I did find it a bit hard to configure new resolutions with SB II.
> But the hardware/software supports just about any type of monitor
> even RGB.
> There is also BlowUp that has hardware similar to SB II, but I have
> never tried that one.

Yes, somtime itï¿½s not easy to find nice resolutions, but it works.

> I don't think that my Falcon was sick in any way. I have heard from
> other Falcon owners that also could not do 57600 in 640x480.
> Also have heard from some Falcon owners who could go higher than
> 57600 without any modifications.

I think thatï¿½s mostly a question for what the installed..
With HSModem they got allways more as 57K6

Using here 115K2 with CT2/MagiC6

> My Falcon has always had a Excellent Sound System without any
> modifications. I get excellent results with D2D recording.
> No Clicks or BassBoost in the Audio. Also everything else has
> worked great with this Falcon. I just happen to have one that

Same as here.

> Now with the CT2B installed I can easily do a port speed of
> 230400. I bet it would go even higher if possible.
> This just goes to show how good this CT2B I have is.

Right, if modem or ISDN adaptor like this speed, use it.

> The 1280x960 16colors I got with SB II was indeed a interlaced mode
> as far as I know. Also this is about the only default res in SB II

> that is in interlaced.

Hm, used SB3 before CT2, never tried this resolution. Icons to smal :->

> I do understand that more is needed than to just turn off the
> Blitter. I would like to have a program that does what NVDI

Thatï¿½s a MUST while using CT2, specialy in turbo mode.
With blitter on, grazy display.

> But this time I installed Cecile on the IDE Drive C boot partition.
> Guess What?
> The Falcon booted up the First time I tried it, in Turbo Mode
> using Cecile instead of HD Driver v.7.71. All SCSI Drives
> came alive very Fast. No problems at all. This was with this
> long 5foot SCSI main cable.

Thatï¿½s it. Correct way. Same as here. Same with HDDriver.

> Since most of the documentation of Cecile is in French, I was uneasy
> about installing it. I should have did this days ago. I knew it
> was something simple. Apparently something in HD Driver is either not
> set right or it is not compatible with my CT2B board.

Install Cecile? For what?

On any ct2 machine i saw, cecile comes from the internal flash, scanned
all devices, finishd. Machine boot from c:/ ide.

> Cecile has a nice configuration setup that is in English however.
> I've not tried the Fastest ATA IDE settings yet, but will soon.

Yes, but you doasnï¿½t need that if your drives are running before CT2.
All devices, some older ones not, works in the same way as before.
No new driver installation needet.

(Only you have a brand new device)

> Now what I really need is some English docs on Cecile or any info
> about it.
> I have several IDE partitions over 800megs. AFAIK they seem to work
> fine. But I need to confirm that CECILE does support partitions
> of 800megs or more for IDE and SCSI hard drives.
> If anyone can help or give any info on Cecile, it is much needed.

Thatï¿½s a question for TOS. TOS 4.04 allows partitions sizes to a maximum
of 1024MB. Iï¿½m not sure cecile allows more as TOS.

> >Apparently Centek have modified the CT2 installation procedure since
> >I got my CT2 kit, as discussed in another post. Apparently you had to
> >install wires directly in some sockets instead, to achieve the same

No simple single driver avaiable!

If you like to connect this ZIP version, a romport interface AND the
driver from www.woller.de is needed.

SCSI looks easy if you also have an SCSI host adaptor.
(And it is allways faster)

I had a similar problem. It happens that it ocurred when decoding a
jpg with the dsp. I use the jpeg_ovl from Alex instead of the one from
Dieter and it never ocurres again. It's slower but it works.

The dsp in my Falcon must have a problem as I have also this problem
with Aniplayer and 1ST-Guide.

Another thought: after some change on my ISP's side (dunno what they
did) I used to have "reset from remote" or some sort, usually with
POPWatch and sometimes with NEWSWatch. Since I followed the advice to
raise the def_rtt in default.cfg, it's ok (thanx Ronald!). I've set it
up to 500.

(but from what I can see in your answer to Ronald, it should not cure
your problem)

Bye,

If only there was something worth smiling about! Having seen the way things progress when a certain high-horse is gotten upon I was just giving ozk some friendly advise, and thankfully he took it.

At the end of the day if someone wanted to write a damn fine game that ran under MagiC (which is the only stipulation of this contest) then it could be done. Just because you obviously reached the end of your limitations on the Atari, it doesn't mean the Atari has reached its.

Cheers,

Rich

Hello again,
I just put online information about the new Milan060. Hopefully this will clear up some the rumours that are flying around the internet. All the information is completely accurate and put together with the help of Milan them selfs. Note that more information will be released on this page as time advances.
Topics covered on the page:

New Hardware
New Software
Atari Fuji Symbol
Motorolla Involvement
Upgrading original Milans

That's it,
--
Bengy Collins collins@bulli.com

MagiC Atari powered by nemesized Atari Falcon030.
MagiC Mac powered by Apple iMac 233

Please visit MagiC Online http://bengy.atari.org

He, I think you're overlooking the fact that the Imation Superdisk
only reads 1.44 disks.
As Josh has a ST his old floppies are most likely in 720 kb format.

Maybe he can use a null modem cable and a data transmission program, like
Connect 95, Starcall, Rufus, etc. to transfer his data from ST to Imac.

I personally use a Microtek E3 with my Falcon, and it's fine. The
quality is fine for web pages, and most print applications, so unless
you really want high resolution quality, a s/h or stock clearance E3
might be an economical way of getting into flatbed scanning?

Kind regards

Hm, i donï¿½t know this trouble.

Sometimes here, cab stuck if the internet connection stucks also. At
that point >ESC< button also doasnï¿½t work. Thatï¿½s all what i can say.
Mostly after few seconds the transfer continues, if not, only an reset
quit that.. (With MagiC, TOS, CT2 turbo/normal mode)

At this point, MagiC manager shows CAB as "supended"

(I think CAB crashed if the connection get lost for xx seconds)

> But as I said, once it freezes, and I reboot, I can use CAB without any
> problems for the rest of the day. It's almost as if CAB were a sleeping

Yep, same here..
But..
I see (sometimes) exactly the same with Communicator 4.5 on Mac..
So i think thatï¿½s a fucking problem of my ISP.

> *I know, it's kind of a silly analogy, but I think you see what I mean. : -)

Yes :)

> No proxy. And I know it's not a problem with the settings, because after it
> freezes the one time, and I reboot, it works 100% ok.

Hum..
Suprise, same as here..

> Yes, CAB cache is on an external SCSI partition. And the freezing up I'm
> talking about is NOT the same type of freeze up caused by the Falcon SCSI bug
> (where the HD "busy light" stays lit). This is just the software itself
> locking up, the drives are not involved.

Makes no differences here, i put if back to IDE. (A bit faster) ;)
Same procedure. Same with unmodified falcon, FX-Board falcon..

Canï¿½t say how the problem is.

O.K, i see, you know the falcon SCSI problem. So we have to look to
other things.. wish i found that..

(Itï¿½s not hard, but if you got this freezing 3-4 times any online
session.. :/)
One per week is o.k :)

> I'm sorry to hear that! Here in California (USA) the call to my ISP is local,
> and therefore free (with the exception of the small amount I pay each month
> for

> to phone costs (and gasoline!).

Yep, i know that. I was in USA three times ;)
Two times FL/Orlando, Tampa, St. Petersburg, Keys.. fucking long
aligators down there :-> , one time GA/Atlanta, all nice trips :)
(That big brown tower in atlanta, same as here in frankfurt!)

Phone is fine cheap :), paying nothing for 50 miles call.
Also gas, jeans, shoes and some more are very cheap :)
Last time filled up the car for 10$ around..

Never saw bigger computer markeds as in United States .)
(Not engough money left to visit them all..) (Wife kicks my as) :->

But the language..
I think i never learn that better .. :)

Food ordering works good, but smaltalk.. -> hard.. :)

Remeber my to checkers.. (Nice burgers in FL) :-))

> Thanks for your help.

No problem

I use my ZIP drive to transfer data from atari to mac and from mac to
atari. All what i do is to format the ZIP as DOS medium (Hddriver)
Works fine in all directions.

Try to create a normal 1.44HD disc on your atari, iMac must accept that
format. (Ii¿½m not sure imation superdirver do that too..) (Sorry)

HD-Driver recognise both IDE-ports on the Milan. If you could find out how
these work on the Milan and "clone" them on the TT it would be a very nice
add-on :-)

I do remember seeing that in the Centek docs, but surely
didn't think it was the si.cpx from NVDI that had to be
removed.
>
>Don't use si.cpx
>
>So, you know what to do.
>
Yep, it is disabled now.

What about the NVDI Compatibility CPX should TOS Compatibility
and Line-A be checked with the 'X' or not?

Of does this CPX from NVDI also need to be disabled for the
CT2B?

I think this goes to show how much we do need a custom patch
for the CT2 Turbo Modes that does what NVDI does without these
un-necessary options.

Thanks,
phantomm@kih.net

From: darkchyld@pcc-uky.campuscwix.net
Message-ID: <7ktvvj$jh9$3@news.campuscwix.net>
Source record: 76703

On 24 Jun 1999 01:09:21 , Phantomm wrote:

->Hi Ronald,
->Good. Thats a nice res. Can you do that in True Color with the
->Nemesis?

No. The highest I can get with Centscreen (or VI2) with TC is
640 x 480. Note that I never mention interlacing. Using Interlace
I can get higher res's with TC, but it makes my eyes/head hurt
and just isn't an option for me... Doesn't seem to bother some
people! ;-)

<snip>

->Are you using CentVidel to configure new resolutions?

I played around with it, but couldn't really seem to get much more
than what Centscreen was giving me as default options (without
going the interlace route).

->It works with CentScreen and is easy to use once you mess with it
->some.

I like their software from what I've seen of it. Have you used
Videlity? (its freeware now). If so, how do you think it compares
to VI2 and CentScreen?

->So far I've been able to get 720x720 in True Color, this is with
->the clock at 50mhz. Not sure if I can get 800x600 TC or not. Maybe
->the VGA adapter modification would help. This res is rock solid
->steady too.

<snip>

Hmm...from the posts I've read from other C2 users, you can get
very nice resolutions in TC mode... BTW, at 720 x 720 don't you
use that standard aspect ration on your monitor? ;-)

->I downloaded Vidility, I see that it has SB II support. It looks
->pretty good. But CentScreen is my choice at the moment.

Never mind my question above then! ;-))))

->Have you tried CentView the picture viewer? Thats real nice also.

Not yet. Has it been released as freeware as well?

->Ronald, could you ever do a working port speed of 57600 with your
->Falcon before you upgraded?

I don't know. I only have a 33.6 modem here, and my phone lines
won't let me go over 28.8 (often dropping to 26.4). ;-(

->Also, with the Nemesis did it increase the working port speed?
->If so, how fast will it go now?

Ditto, see above...

>
> Vuk

Address area of IDE port is : $F00000-$F0003D. How is for secondary port,
used by Milan, it should say to us somebody from firm Milan or Uwe
Seimet......
Also, length of buffer depends of used driver. Btw. Atari ST has 1KB
system buffer for disk operations.

Everything is possible, so making IDE host adapter (controller is wrong
world, it's in drive) for TT with higher clock is also possible (Milan has
clock of 60 MHz as I know). But knowing situation in Atari scene, I suspect
that anyone will make such project.

Pera

Message-ID: <930258855.1104@www.remarq.com>
Source record: 76709

Umm, it's weird that ties to port speed and the CT2 have
come up. I have three Falcons. All of them (before
modifications) work well with a Supra 33.6 and port speed of
115.2K. Most connections are usually around 26-32K. I did
try a new 56K flex modem at 230.4K and it was kind of
flakey, but neither my Mac (at 57.6 port speed) or PC at
115.2 port speed could utilize the 56K's speed (I could
never get a 56K connection). On my girl friends PC at her
house, the 56K modem works fine, so I think my phone lines
are crap.
Also, I remember the HSModem author stating that DRIVN.PRG
and SCC.PRG should not be run from fast ram because of
timing considerations. I haven't had a problem there, but I
haven't run a Falcon bus over 21Mhz (yet:).

Oeps I didn't read your posting very good.
Ofcourse if it's a *.hqx archive it very unlickely it's intend to be used
on the Atari.

Luckely you didn't say 100%. *.hqx files (allmost all) can be unpacked on
the Atari.
On the Belgian ftp-server you can find a little utility called 'xbin.zip'
It's just the binairy, there are no docs.
To use it just drag & drop the *.hqx file you want to unpack to the
program.

ftp://193.190.204.128/atari/archivers/xbin.zip

Sure, because in the latest versions you can use a "Photocopy mode" which is very
usefull for making direct photocopies ;), but you must use NVDI at least version 4
I think to make this mode operationnal ...
Also zooming is possible ...

| . . . .

I have an Epson GT-5500 working with my Hades. The scanning program is Look 2 but I need three different versions as usually one or two don't work depending on the mood (or atmospheric pressure or position of the planets). The problem may well lie with the SCSI interface and I know that there is no problem when the scanner is used on the TT.

Which is quite useful. With a -F or -FF option activated, ZIP2 can recover
the good part of a damaged ZIP archive. And there are some other very
convenient options, like converting between <LF> and <CR><LF> line ends, etc.

Btw. ZIP2.0 is a part of the "Infozip" package which is an attempt to create
and maintain a portable ZIP archiver/dearchiver. The full package contains
source code (in C, with specialities for different OS-es) for several
programs:

ZIP - for archiving;
UNZIP - for dearchiving;
ZIPINFO - for brief or verbose listing of archive contents
ZIPSPLIT- for splitting a ZIP archive into several smaller files
ZIPCLOAK- for encrypting archives

I use that package quite a lot on a VAX/VMS system. Is's convenient when
transfering bunches of files between my Atari and the VAX.

>Installing STinG 1.20 is almost like starting anew, except that you

I was (I think) quite careful to replace all components of STiNG when I installed V1.20; At first everything seemed to work OK: CAB 2.6, Newsie 0.94 in e-mail and ftp functions (I do not know about news- did not have newsgroups available at my ISP at that time).

But then I noticed a weird problem in cooperation of the new STiNG and Newsie 0.94: when sending LONG e-mails from Newsie (for example an e-mail with a file of at least 80KB attached), the transmission of e-mail never seemed to end and could not be interrupted either, so I had to reboot.

The problem was repeatable: sending short e-mails was OK, long ones hang the computer. When I deleted STiNG V1.20 and reinstalled V1.15 everything worked OK.

I have set the DEFAULT.CFG, DIAL.SCR and the CPXes for STiNG V1.20 as I thought should be OK, and after this problem appeared I rechecked that settings were identical as in V1.15; no help. Then I copied the DEFAULT.CFG and DIAL.SCR from V1.15 and used them with V1.20, but with no change.

A detail that might be significant: instead of regular exchanging of "send" and "receive" LEDs on my modem when sending a long e-mail with Newsie+STiNG 1.15, with STiNG1.2 the "send" light is on most of the time, and "receive" blinks only for barely noticable instants.

Any suggestions? Have I overlooked something, or... ?

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

<h3>Click for WebSite!</h3>

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

You'll need to clear the RAM cache whenever it gets close to full. I have it set to 9 megs at the moment, but I've tried different settings. I always clear the RAM cache whenever graphics from a previous page start to load from disk instead of the cache.

>
>Any ideas on how to do this in Newsie?
>
Most mail lists have a "Reply-to" header in the mail. You should find
your KILLFILE.TXT file in the work directory and edit it following
the directions in the file by adding a replyto line with the replyto
address.

replyto<tab>zetnet-atarians<tab>transfer<tab>zetnet<tab>auto-route zetnet messages

Use the tab key where <tab> is located.
Thus any email with any part of the replyto header that matches
'zetnet-atarians' will be transfered immediately to a mailbox 'zetnet'

Sorry this is not in a dialog yet. You still need to edit files.
If you no longer want it, just change the first character to a '#' to
skip this entry.

Yes, I have seen it with other popup menus. I have not been able to
duplicate it at will. Sometimes it works, other times not.

The NOVA card is not responsible, because my Falcon is stock.
It is on the 'bug list'.

Hi Johan,

That is very interesting. I sure would like to see someone attempt
to do this. And maybe if possible optimise the code especially
for TOS 7.X for the CT2B.

Thanks very much for your help,

>
> Later! ;-)

Hi Ronald,
Good. Thats a nice res. Can you do that in True Color with the
Nemesis?

I really like CentScreen. Thats what I'm using. Only problem I see
is that the video file "video.dat" has the same name as the FalCam
video.dat file that goes in the root folder.
Not sure if one of them could be placed inside another folder or
renamed.
Are you using CentVidel to configure new resolutions?
It works with CentScreen and is easy to use once you mess with it
some.
So far I've been able to get 720x720 in True Color, this is with
the clock at 50mhz. Not sure if I can get 800x600 TC or not. Maybe
the VGA adapter modification would help. This res is rock solid
steady too.
Also, I can get any TC res as long as the Horizontal doesn't go
over 720 which seems to be the limit on my SVGA at the moment.
If you have a multiSync then you maybe able to go higher in TC
mode with CentScreen
Also, can get the 800x592 in 256c. And was able to get the 1280x960
in 16colors this is in interlaced with the clock at 50mhz.
That is just like the ScreenBlaster II 1280x960 16color mode. I'm
pretty sure I can do 256colors in the 1280x960 res. If so that will
be a nice res to work in. I could never get SB II to go into 256C
in the 1280x960 res.
Not tried anything higher than 1280x960 yet. But it looks like I
do have the Bandwidth to go higher.

I downloaded Vidility, I see that it has SB II support. It looks
pretty good. But CentScreen is my choice at the moment.

Have you tried CentView the picture viewer? Thats real nice also.

Ronald, could you ever do a working port speed of 57600 with your
Falcon before you upgraded?
Also, with the Nemesis did it increase the working port speed?
If so, how fast will it go now?

phantomm@kih.net

1114. IDE on TT

Newsgroup: comp.sys.atari.st
Date: 1999-06-24 00:00:00 UTC
From: vuk-@geocities.com
Message-ID: <7ks750$mr9$1@as102.tel.hr>
Source record: 76774

Yes, TOS 3.06 can boot IDE, but...

I have one IDE controller in Mega ST, with (my-fixed) TOS 2.06, so now can boot IDE 1 as well.
But, when I asked some guy who made some IDE controllers for ST, why not for Mega STE (I have one), he told me that problem is with clock of computer (8/16 MHz), and those controlles he making must be attached directly to 68000 (as this one in Mega ST).

So, on TT ? I have CaTTamaran, and I think it is more difficult to make this controller switch 32/48 MHz then MSTE 8/16...

anyway, IDE controller on ST is very simple (it's easy to myself saying that, I'm pretty dunno for hardware), just 256 bytes buffer, adressing $FF000000-$FF0000FF (not sure, have to look...).

Vuk

1115. Need NOVA divers MSTE

Newsgroup: comp.sys.atari.st

Do you mean is a hqx or sit file ? If that's the case, then I'm 99.999%
sure that it is not for consumption on an Atari.

Atari compressed formats are lzh, zip, arc, zoo, and maybe a few others.
zipfiles can be unzipped by MacZip, the others will probably have Mac
de-arcers too, but you will usually want to decompress them on the ST.
You can get programs for these on most FTP sites. Check out the Quick
FAQ.

dlanor@oden.se (Ronald Andersson) wrote:

> I still don't see the point of most 'screenblasters' etc, as Videl Inside
> could provide 960x720 without any new clocks at all, provided that a good
> and flexible Multisync monitor was used, and to use higher rez on a Falcon
> with safety you must have a real accelerator anyhow.

Well, to get decent resolutions with my old, standard SVGA I had to use a 36MHz pixelclock to get correct aspect-ratios. Also, using a pixel-clock that's separate from the system-clock is very important with some accelerators (perhaps not with the CT2). E.g. if you have a Nemesis or Speed Resolution Card you'll loose sync if you for some reason had to switch to another clock (e.g. slowing the Nemesis down to 20MHz when printing under MagiC).

But *buying* a "screenblaster" is pointless, it's very cheap and easy to modify the Falcon yourself (http://atari.nvg.org/pixelclock/pixelclock.html). Combine it with Videlity and you have a extremely reliable and stable "screenblaster".

Yes, HDDRIVER fully supports (i. e. also high level) access for DVD-RAM
media. For other media additional high level drivers are available.

Shouldn't this just be a matter of using faster logic on the IDE interface?
I did some tests with a commercial IDE interface from Hard&Soft, a german
company. The interface couldn't cope with faster processors than the
ordinary 8MHz. However, with another hardware solution the 16MHz speed
worked fine.
The general tip is to try to use lookup table-type circuits instead of
gates. If you're lucky, you don't even need to move up to a faster logic
family.

> anyway, IDE controller on ST is very simple (it's easy to myself saying
that,

The PC motherboards usually have two IDE channels, why don't we? Any ideas?
If there is nothing else intended in the memory map why not reserve a space
for a secondary IDE bus? It don't have to be bootable.

However, I'm not at all familiar with the software driver part of the
problem at all. My guess is that the driver would have to be rewritten or
hacked into for to see the new IDE interface.

Yes, here ii¿½m .)

> I am getting a error drive not responding message in
> both Tos 4.0X Turbo and Tos 7.x Turbo.
>
> Normal Falcon Mode works fine.

Using an yamaha 4260, toshiba xm53xx 12-speed and an very old
toshiba xm4101. They all works well in turbo mode (TOS7)
ExtenDOS -> latest release 3.01

But..

Same hadrware configuartion with CD-Recorder (Soundpool) only can use
the burner in 1-speed. Laughing.. :/

ExtenDOS use CDRW 2-speed, any CD-R in 4-speed

Normal mode CD-Recoder also works fine.

Regards, Robert

A long, long time ago, in a land...wait a minute...
I remember when I first used NVDI a while (long) ago, I too has some reasons for not wanting to always load it. After getting the Mighty Sonic in '92, it became a fixture in my autofolder. The only reason I can think of not running it would be some games. I guess with the NOVA VDI I could get away without it and use another GDOS, but haven't looked into it.

>How do these results look?

Looks like you have your CT2B working:).

>Are there any other programs like NemBench I can use to see
>what I've got with the CT2B?

"How Fast" is a nice tool for determining the most effective size of hard disk buffers.

"Memspeed" will test the speed of your ST and Fast ram.

"FPU Bench" will test the speed of your FPU.

"FPU Test" (?) will increment FPU calculations and check for float errors (AFAIK). I find this useful for getting the clock set on my Mighty Sonic. Sometimes the FPU will work, but produces errors that are not visable until you run an app that utilizes it. Gembench doesn't run enough calculations to find a clock problem. The CaTTamaran on my TT drove me nuts until I used this app.

>blank window, and the the ST locks up.
>
>Does anyone happen to know why its doing this?

STinG itself does not link into any filesystem, and does not directly
interfere with any window operations. But it is possible that some
mistake in the installation has crashed some memory pointers somewhere,
and in that case there is no telling what they might point to, nor how
that might interact with other programs.

I hope you did read my UPDATE.TXT files (that is why I wrote them).
You can't succeed with updating an old STinG installation if you
do not follow the rules of updating as described in those files.
Some old parts are incompatible to new parts, and those old parts
must be removed, or they will cause some of the new parts to crash.

Installing STinG 1.20 is almost like starting anew, except that you
can keep the old DEFAULT.CFG, CACHE.DNS, and ROUTE.TAB. The STING.PRT
file used for STNGPORT.CPX may also be used as basis for a new one, but
you must save a new one (as the port drivers have been updated) after
checking that port settings are ok with the new STNGPORT.CPX.
(All this after installing all stuff and rebooting of course.)

You will also need to reactivate STING.CPX, set its 'delay' to 10 or
20 ms (depending on how fast your machine is), and save those settings.

>In the meantime I'm back using Sting 1.08
>
That is a very old version. Did you miss the previous release ? (1.15)

As you have been using so old a version, there are many new features in
the dialer settings that you should check out. And don't forget that the
new dialer has built-in configuration dialogs. You don't have to do all
of that with a text-editor anymore (though the SCR files are still ascii).

>Also I notice that the latr version doesn't have the modules for the midi
>port or the centronics port, are they no longer supprted or do you use
>the files from 1.08 to utilise these ports?

Those 'ports' never were supported by those STX drivers. They were merely
near-empty placeholders for the future.

The MIDI.STX was intended for a future 'ring-type' network with lesser delays
than we get simply by using Midi ports connected in a ring today. As yet no
one has wanted to take up that project, so the current Midi driver remains
(as it always has been) the SERIAL.STX module.

CENTR.STX is another project that has never been finished, although I did
some work on it that I have had to abandon due to lack of time for debugging
it. When/if it gets completed it will allow a fast link using the printer
port, thus allowing STs a fast parallel link

As STinG does not need any 'placeholders' to allow future modules to be
installed, I have decided to remove these files from the distribution,
until such time as we can provide functional versions.

It is also *vital* that you erase those old modules when installing STinG 1.20,
as the port driver structure has been changed to allow a necessary function to
be added to all new port drivers. An old module using the old structure will
cause STinG to malfunction, so none of those can remain when you install the
new STinG 1.20 modules.

>Any help would be most appreaciated.
>
I hope the above is of help, and do take a look in the UPDATE.TXT files
that exist in several of the subfolders of the STinG 1.20 release package.

Well, all longname filesystems are not equal. VFAT has some limitations
that I know of (no full character case support), and perhaps it also won't
accept leading spaces in filenames. The MagiC XFS ramdisk I spoke of does
not have either of these limitations. But even so, it could be STZIP itself
that objected to the leading spaces, so it might not have worked anyway.

>Sounds like a goo diea. BTW, can you tell me just what the overlays
>actually do? And why 'overlays'?

CAB itself has no STinG/STiK/MintNet client functions at all. It does not ever communicate directly with the TCP/IP stack used to connect to Internet. Instead it has a special protocol of its own which it uses to communicate with the CAB.OVL. As for the extension OVL, the overlay term usually means temporarily loaded modules that use RAM which may be used for other purposes at other times, including other such modules, (thereby overlaying) That is not really how the CAB.OVL is used of course, as it would waste too much time.

But originally, CAB (differently named) was merely an offline viewer for html files, and the ideas for the module handling and the protocol, that makes it into a real web browser, probably grew out of ideas based on the 'overlay' concept, and now the name has stuck.

AFAIK however, all existing CAB.OVL versions do stay resident throughout a CAB session. Unlike true overlays they are never 'unloaded' to make room for any other.

Actually that is an AB-specific characteristic you describe, since
this accelerator unfortunately lowers the speed of ST-RAM accesses.
That is why a graphics card is such a burning need for AB-users.
(As has been discussed in several earlie posts.)

Of course I could put a graphics card to good use too, but I don't
really feel any driving need for one.

>With the fVDI shadow buffer things would be a lot better on an AB040
>(no reads from ST-RAM). It's very noticeable in 16 colour mode.
>
Yes, that should make a big difference.

Am I correct in assuming that this 'shadow' argument on the driver
specification line should also have such an effect on any system
with FastRAM (such as my own) ?

----- snip ----- re: usable resolutions for 16bit Hicolour ?
>
>I've played around a good deal with my BlowUP Hard II, though, and the
>only decent 16 bit mode I could get was 480x480 (this is on a standard
>30kHz and up multisync monitor, and only counting non-interlace modes).

Then 'BlowUP' was the wrong tool, that's all. Like many others it will
refuse to let you use any of the base pixels clock undivided for Hicolour.
('undivided' is what some call 'quarter pixel') But it is a fact that it
does work for the 25 MHz base clock, if the software is smart enough to use
it. All you need to do is to use Videlity instead. (Now freeware.)

Theoretically it can be done even on a stock ST, except that it will
then be heavily overloaded and bomb. Also, on an AB-Falcon you will
still have that problem of slow ST-RAM access to contend with, even
though the CPU itself should happily run software in FastRAM without
being affected by the fact that VIDEL has more work in ST-RAM.

>>I would not call either 768x576 or 640x480 useless, and though some may
>
>But neither of those modes is available on a setup such as mine.
>You need at the very least a Nemesis or a 15kHz monitor.

No, that is not so. You need a software tool that can set up a pixel
clock of 25 MHz for Hicolour mode, and make it work right. Videlity
does this job fine. The result is a bog standard VGA signal for the
resolution 640x480x16bit at 30+ kHz (there is room to choose), and
60 Hz (or a bit more even, like 61/62). Naturally without interlace.

----- snip ----- re: MGIF dithering in 16 colour modes
>
>You can get very good image quality with 16 colours in high resolution,
>but you have to be able to select those 16 colours yourself.

But that is the trick of course, and it really doesn't look good in any
multitasking environment, but only in a dedicated program taking up the
entire screen. (Not criticising, but just commenting.)

Actually the same applies to any palette-based mode where the picture
viewer can't do what it needs to without modifying the palette.

Personally I use 1stGuide as my main JPEG viewer, and use its palette
(for colours >=16) as my normal 256 colour system palette. Thus JPEG
viewing never changes any of my palette colours. Unfortunately I've
never found any GIF viewer that will work the same way, using the same
palette.

----- snip ----- re: the possibility of me doing some fVDI driver(s)
>
>There is no source code for graphics cards there, since I'm not sure
>yet if those can be released (NDA's).

I didn't mean it like that. What I meant was your fVDI drivers for the
NOVA card. I'd much have preferred to have the source for the 4 bit
driver with Atari bitplane layout.

>Since fVDI is (or rather will be) under the GPL, you can have the entire
>source tree (except the mach64 driver, for now) if you like.

I like. :-)

>>I have now made some rather extensive tests of fVDI with the 4bit VIDEL driver.
>
Replying to myself here: That was a bad choice of words above, as the driver
should in no way be specific to a Falcon. I should rather have described it
as the 4 bitplane driver for Atari bitplane format or something like that.
I don't want to make it seem as if I favor unwarranted hardware dependency.

>>My intention was of course to test the 1bit driver too, but I never got it to
>>work. fVDI never did switch to a monochrome resolution, but stayed physically
>
>No, currently fVDI always stays in the resolution you started it in.

But on a Falcon that would mean you have to change NVRAM to switch fVDI rez
legally. Rez switches in \AUTO\ are not fully recognized by the system, and
in any case none of the standard resolution enhancers will switch this way.
At least none that I have tried can (CentScreen, Videl Inside, Videlity).

>As I said in an earlier article (not in this thread), it's easiest to
>test fVDI by starting it from the desktop and then you can of course
>be in whatever graphics mode you like.

Yes, but it is not fully realistic testing. One very important test is
to see if the current AES (for multitaskers) and desktop can start up
correctly, and then use fVDI correctly in the new rez.

>>At first I experienced bombs on every boot, not when fVDI started, but a bit
>
>A little while ago there was a note in the documentation saying that
>booting wasn't really supported in the normal Atari modes. I think I've
>removed most of that text now, though, since it seemed to work last time

For me it did work, when the post-boot rez was identical with the boot rez
set up in my NVRAM.

>Again, testing of fVDI really should be done from the desktop, unless
>you want to run below NVDI.

Ok, gotcha, but I still think it is a little limited testing then.

----- snip ----- re: debugging to find the mouse handler bug
>
>It's, unfortunately, really troublesome booting under a debugger on the
>AB040. I've only found a single debugger that can do it at all, and then
>only without caches and FastRAM. It still usually crashes in some strange
>way before I'm finished with what I'm doing.

I know, and it's even worse with multitaskers etc, and often their bugs
are unique so you really need to debug under those systems. For this case
however, singleTOS testing was enough, and then it is easy to use AMON
even with a CT2. The only limitation is that the rez must be derived from
the 25 MHz pixel clock, as that is the only one AMON can use correctly, as
CT2 has moved the 32 MHz clock to another input and placed the 50 MHz
clock where the 32 MHz clock used to be.

Whenever it can be used AMON is definitely the best tool for debugging
AUTO programs and ACCs. But I doubt that it is '040-compatible...
Still, the CPU's are closely enough related that it might be, or that
some minor patch could make it so.

----- snip ----- re: more on the mouse handler bug
>
>I've only booted in the bitplane modes once or twice since that mouse
>code went in. Apparently I was lucky.

If that's the word...

That fits my results perfectly. Is that in the 'global' part of fVDI, or
in the separate driver code ? (Global I hope, so a single fix will do.)

----- snip ----- re: and still more on the mouse handler bug
>
>No checks are really needed since the mouse is limited to the coordinates
>found among the LineA variables.
>Naturally, that doesn't cover a redraw before the first move, though...

Correct, and I agree on the lack of need for limitation in normal operation.
Those routines should not have to waste any time on that.

>>better, and that needs to be done at each rez change, as even after an
>
>fVDI doesn't know about resolution changes at all yet. Mainly because
>it can still only load one driver.

But that will have to change eventually, as rez changes are an accepted
part of the overall system, but it is a very simple matter to enforce
extra limitation on the mouse handler at a GEM rez change.

>>I used the 'triple switch' method to activate the old mouse drivers of TOS,
>
>Until very recently that was the only way.

That doesn't matter, as long as it is documented.

>

Ok, but for full compatibility some fixed colur will need to be added here.
GEM is not specified to be limited to monochrome text.

>This is very fortunate since it would otherwise be impossible (or at least
>very difficult) to use the NVDI vector font support on graphics cards.

Yes, and the only loss is the fVDI capability for setting system font, which
is not really necessary as other tools can be used for that purpose. It was
never a specified function of any GDOS except NVDI, and NVDI does not allow
any size flexibility for such fonts anyway. So it's no lost 'standard'.

>>completely, and when used 'below' NVDI I am not even certain that any of
>>the fVDI code was still in use. I had no indication of it anyway. With
>
>When fVDI is 'above' NVDI, it doesn't let the latter do much at all.

Plus the font handling mentioned above too, you mean ?

>With fVDI 'below', it can indeed be a bit difficult to see anything,
>but you will currently, for example, not get any filled circles, there
>will only be solid lines and in 16 colour mode the text and icons will be
>monochrome. If any of those things look normal, you didn't set things
>up correctly. ;-)

No, what you say is correct, I did get colour limitations.

----- snip ----- re: failure to change rez for fVDI
>
>That is not the problem. fVDI is perfectly happy with any resolution.

I've understood this from what you said further above, but this is the
sort of thing I think should be changed to achieve better integration
with how the system normally works. A VDI should follow rez changes.

>However, I've not yet spent the time figuring out when those resolution
>enhancers actually do their thing and/or what to do about it.

I had to solve how to do this compatibly to multitaskers etc in LaceScan,
and even though Falcon resolution enhancers differ in many things, they
can not differ in all of these things, because then their compatibility
would inevitably suffer.

Essentially there are two kinds of rez change. Low level change using the
xbios Setscreen call, and high-level change using v_opnwk (1-10,...). The
Falcon has additional xbios calls of course, for VIDEL modes, just like a
TT has other specific xbios calls. I am familiar with how this can be done
in reimplemented versions of all but the Falcon call, as I have made a TT
version of LaceScan as well. (Still not released)

The tricky parts are really for the enhancers, fVDI just has to link in
with some of the dispatcher functions so as to catch the rez changes on
'the fly' so to speak. It doesn't even have to interpret arguments or
anything, but just make sure to read all the relevant VDI/LineA variables
afterwards. The rez enhancers have to do the rest, because that is how
they have to work in forcing normal TOS to accept new resolutions.

I'm not sure if fVDI is supposed to support gemdos/bios screen output
as well, but if not then all the low level rez changes can be ignored,
as proper VDI output through virtual workstations should only recognize
rez changes at GEM level (reopened non-virtual screen workstation).

>fVDI simply assumes that the mode set when it's started is the one that
>will be used when the workstation is opened.
>It would probably be enough to check the LineA variable at the v_opnwk,

That is the basic measure yes. But some variation on this may be needed,
as it may be necessary for the enhancer to be 'above' fVDI (booted later)
in the chain, and it may save some variable changes until after the return

from the v_opnwk call. That would be quite normal, as it is then that
it gets a chance to correct wrongful assumptions of TOS routines.

fVDI can handle such things by having a special flag to indicate that the
next VDI call, no matter what, should be preceded by updating rez info
from VDI/LineA variables. Another good method is to temporarily relink
the fVDI dispatcher to a routine that first updates rez info this way,
and then relinks the main fVDI dispatcher again, and jumps to it. This
causes no extra delay for the main dispatcher, as it never has to test any
extra flag. (There are other methods too of course.)

>but for that to do any good fVDI would have to be able to deal with more
>than one device driver.

Yes, but that is a rather obvious need anyway. One way to handle this is
to load all specified in FVDI.SYS during boot, and then load the active ones
as and when needed. Another is to only save their paths during initial boot,
and then load the files at v_opnwk. Both methods are satisfactory, and for
best GDOS conformance both should be implemented ("r" present in spec or not).

>Naturally, I will add the little LineA check sooner or later (if noone
>else beats me to it ;-).

Good. Then I won't have to talk you into it... ;-)

>Many thanks for the comments, not to mention finding that bug! ;-)

I'm always glad to be of help.

Use Stuffit Expander. Just make sure the Stuffit Engine is present,
which is required for LHa and Arc support. LHa folder structures will
remain intact after decompressing. In rare cases an "unsupported" error
will occur, whereas MacLHA and LHA Expander will handle them.

> Kind regards
> Mike Kerslake

just as a point of info also:
generally you will need a scanning resolution about twice what the
screen you will be using.

If you are printing something that will be photocopied, you should use
about a 60 line screen.
this is 60 lines per inch. much higher screen and the photocopier will
not be able to render
the gray areas of images very well. so if you are printing out using a
60 line screen, then
all the resolution you need to scan at is 120 dpi, for *size as* images.
(that is images that
will not be decreased or increased) If you want to reduce the image to
50%, then you only
need to scan at 60 dpi as reducing the image by 50% doubles the dpi.
i.e. a 1" x 1" image
at 60 dpi when reduced to 1/2" x 1/2" is now 60 dpi for 1/2" therefore
120 dpi for
one inch. Conversly if you want to double the image size then you need
to scan at 240 dpi.

So for 60 lines per inch screen output you need a scanner capable of
from 60 to 240 dpi.

If you are not photocopying the output, maybe having a professional
printer print it?, then
you will probably only need 85 lines per inch. A lot of magazines are
printed with that
screen. So you would need a scanner capable of 85 dpi to 340 dpi.

It is unlikely that anyone who is not working with high quality art
images (greater than 120 lpi)
will need a scanner capable of more than 300 dpi.

Web images typically are 75 dpi as monitors cannot display any higher resolutions
at standard configurations (800 x 600, 1024 x 768,...) to check out your situation take your resolution
and divide by the number of inches your monitor is wide. i.e. 1024 / 15" = 69 ppi
that's a rough calculation but should give you an idea of a monitors resolution.

In summary I think buying a good quality colour scanner that with an optical resolutiion of 300 dpi
is more and more affordable these days, esp. easy to pick up second hand, as "everyone" seems to be
buying the 600 to 1200 dpi scanners (equating more resolution with better quality)little realizing
that there is no need for such high resolution! Needless to say these are probably the same people
who are buying macrosoft windows. UMAX and Microtek SCSI scanners are supported by Homa House.

Why not plug it into your TV? Then it'll be as large as you want! and
for games/demos and various applications you'll need one anyway (or a
colour monitor, which will get a better quality picture, but a TV wil
suffice, trust me!)

> I also need a hard drive and software! Anyone help me out??!? =)

Don't know where (geographically) you are, but consider an IDE Burster
kit. Will let you fit a standard PC IDE hard drive to an ST. Doesn't
cost the earth either. ASP (in the UK) sell them.

Software, what kind? There are loads of FTP sites around. For games?
http://lgd.atari.org contains a few (thousand :)

> Would you recommend the ST1040 for a computer, I have it, but I rather
> have a TT and dEF a FALCON!! =) (i wish!) anyone wanna do alot of
> trading for a falcon??=) I want one! =) heh...

You should get a Falcon if you want CURRENT and cool software :)
But hey, the ST is bloody good too, so enjoy!

Cheers,

Rich

1137. CAB 2.7 and printing

Newsgroup: comp.sys.atari.st
Date: 1999-06-25 00:00:00 UTC
From: outrider@lvdi.net
Message-ID: <3773838a21ad7f41@lvdi.net>
Source record: 76647

I recently updated CAB to 2.7 and am having problems printing. It
does its thing for a bit, but then only prints out "Error File not
found." I had no problems printing with 2.5 or even the 2.7 demo, as
I recall. But I did do some rearranging, so maybe I messed something
up. Can anyone please tell me what's wrong?

>
>Installing STinG 1.20 is almost like starting anew, except that you
>can keep the old DEFAULT.CFG, CACHE.DNS, and ROUTE.TAB.

What about the DIAL.SCR, can that be left in place as well?

>The STING.PRT file used for STNGPORT.CPX may also be used as basis for a new one, but
>you must save a new one (as the port drivers have been updated) after
>checking that port settings are ok with the new STNGPORT.CPX.
>(All this after installing all stuff and rebooting of course.)

Right mate, I'll check that one out as I'm not sure now what I did there.

>You will also need to reactivate STING.CPX, set its 'delay' to 10 or
>20 ms (depending on how fast your machine is), and save those settings.

Its a Standard STE I'm using ATM but I will be hopefully using a Mega
ST with the Adspeed board installed as soon as I can get it working
again.

>That is a very old version. Did you miss the previous release ? (1.15)

No I didn't mate, that just wouldn't connect to freeserve:-(

It got as far as inititalising the Link, then bombed out:-(

>Those 'ports' never were supported by those STX drivers. They were merely
>near-empty placeholders for the future.

I thought they had been fixed, thats why I asked, not that I have tried
them out yet, as until the Megas working I didn't need to.

>It is also *vital* that you erase those old modules when installing STinG 1.20,
>as the port driver structure has been changed to allow a necessary function to
>be added to all new port drivers. An old module using the old structure will
>cause STinG to malfunction, so none of those can remain when you install the
>new STinG 1.20 modules.

I dearched the archive and installed everything by hand to the root and
Auto Folder, all I used was the old Default.CFG and the Dial.SCR I
changed the INF files to point to the new insatllations folders as well.

>I hope the above is of help, and do take a look in the UPDATE.TXT files
>that exist in several of the subfolders of the STinG 1.20 release package.

I don't have a lot of time to play about with it ATM:-(

But will try again ASAP.

I've only used interlaced TC with the old RGB monitor I'd do 640x400
TC interlaced. The interlaced mode wasn't very bad on that RGB
monitor. Some are worse than others.

>
> I like their software from what I've seen of it. Have you used
> Videlity? (its freeware now). If so, how do you think it compares
> to VI2 and CentScreen?

Yes there software is very nice. I downloaded it the other day and
messed around with it some. I tried to buy it at one time, but could
never find a Atari dealer here in the US that handled it.
Really haven't tried VI2 enough to give a fair comparison yet.
It does have support for SB II which seems interesting. I'll have
to try that out and see what benefits that gives.

>
> Hmm...from the posts I've read from other C2 users, you can get
> very nice resolutions in TC mode... BTW, at 720 x 720 don't you
> use that standard aspect ration on your monitor? ;-)

I set the 720x720 TC using CentVidel along with CentScreen.
It seems that you have to start out in True Color mode with
CentScreen first, then run CentVidel. After doing that any
resolution you set will be for TC mode. IIRC.
(Someone Correct me if I am wrong on this)
And you do it this way for 16colors and 256colors as well.
Any new resolutions you setup can be stored in the VIDEO.DAT
file that CentScreen will read and will display any new ones
that you setup in that scrollable window.
I started out with 640x480 TC in CentScreen. Then loaded up
CentVidel and started going up slowly. 720 was as far as I could
go with the Horizontal before my monitor went Nuts. So I guess
thats the standard aspect ration on the monitor.
My SVGA has a Horizontal Scanning Frequency of 30khz to 70khz.
When I go up to 720 Hor. TC, my Frequency dropped down to just under
30khz, 29.???? so doing it this way was as far as I could go.

Now this is without the CT2B VGA adapter modification.
I'm getting ready to do that modification and see if it helps.

>
>->Have you tried CentView the picture viewer? Thats real nice also.
>
> Not yet. Has it been released as freeware as well?

Ya know, I'm not sure on that. It came on my CT2B software disk.
I believe it is on Centeks Web Page also. If so, Try it out and
see what ya think about it.

>
> I don't know. I only have a 33.6 modem here, and my phone lines
> won't let me go over 28.8 (often dropping to 26.4). ;-(

Thats about all I can do here as well. But you can do a higher
modem port speed than what you're actual modem to ISP Modem speed
is. There is a difference in that.

If I am correct on this, You have a speed setting for your Modem to
Falcon speed. And a setting for your modem to ISP Modem speed.
This gets folks confused sometimes.

For me, I get better preformance if my Modem to Falcon speed is
higher. No matter what my Modem to ISP Modem speed is.

For example, setting the Falcons Modem port speed to 57600 will
allow data to go from your Modem to the Falcon faster than if
it was set for 38400. Even though your Modem to ISP modem speed
may actually be 28.8 all the time.

What I have been saying all along in previous postings is that for
some reason, probably incorrect software settings, I could never
get my Falcons Modem to Falcon Speed to work at 57600 or higher.
I'm not talking about my Modem to ISP Modem speed. Thats always been
about right.

Now with the CT2B, I can go all the way up to a port speed of 230400
and this makes a big difference even though my actual modem to ISP
modem speed is the same as before I installed the CT2B.

I'd like to get this straightened out. Because some folks say that
they can go as high as 115.2 on a standard stock Falcon.

On 24 Jun 1999 01:09:14 , Phantomm wrote:

Hi Folks,

As some of you know I've had a small problem with using my SCSI
hard drives in Turbo Modes with the Centurbo 2 v. B.

After doing some more testing and etc here is where I am at.

At the moment. HD Driver version 7.71 will work fine with all
my hard drives IDE, SCSI, CDROM, and CDR in the standard Falcon
mode.

If I boot into any of the Turbo Modes. HD Driver will work with
the IDE drive just fine. But will not work with any of the SCSI
drives.

Now I installed Cecile the hard drive driver software from Centek
onto the IDE Boot partiton C:

Cecile works fine with all hard drives and the CD Rom and CDR drives
in standard Falcon mode.

Cecile also work fine with all drives in the Turbo Modes including
my 2 SCSI hard drives. Upon booting Cecile in the Turbo Modes all
drives including the CD Rom and CDR drives are accessed and there
information is displayed correctly.

But, when ExtenDos Gold runs from the Auto folder it reports
a ERROR Drive Not responding for the CD Rom and CDR drive.

When this happens I can see the CD Rom drives led flash like it
is being accessed. Also the CDR drive is also accessed.

But when I get to the desktop both drives are not available.

Can someone with a Centurbo 2 version B. explain to me what I
am doing wrong. Or what I can try to get this fixed.

Why doesn't HD Driver work with any of the SCSI drives in the Turbo
Modes?

And why does ExtenDos Gold report a Error drive not responding with
the CD Rom and CDR drives in turbo mode but not in normal Falcon mode?

I have e-mailed Centek and am waiting for a reply.

Does anyone in here have a Centurbo 2 version B that knows if
any version of HD Driver does work in the Turbo Modes?

If so, how do you have it configured with the CT2B setup menu.

Do I need to set programs such as HD Driver and ExtenDos Gold
to run in FastRam or something like that?

I still don't believe that hardware such as the ScreenBlaster is
pointless. I'm not sure what you can get with this modification
you mention. But not everyone can do hardware modifications.

I've seen folks say that hardware such as ScreenBlaster and BlowUp
are not needed at all and that the same can be achived with software
only. If that is the case, then Why does Videlity have support
for the ScreenBlaster hardware?

I'd really like to know what the highest resolutions one can get
on a Standard Stock Falcon using software only, in 16color, 256color,
and TrueColor Modes.
If anyone knows, then post it in here with the name of the software
used.

I've generally found yellowing to be from nicotine. It seems to react chemically with the plastic. Your brown stains are probably a similar situation. I have never found any solvent that will remove it. One yellowed printer had a scrape on it, revealing the original color underneath, so I would expect the only cure would be a high-speed polisher such as a Dremel tool with a mildly abrasive polish.

Here's a big batch of ST and Falcon hardware and software I want to save from charity donation.. since that won't likely help anyone anyway.

I want only one buyer for the lot, and all offers will be considered.

IF you have a legal tax-deductable charity I can donate it to where it will be appreciated, that might be best for me.... and you.

TWO Falcons
ONE 1040ST
B/w Migraph Hand Scanner
Migraph full page monochrome scanner
Monitor switch
Hard drives and IDC hosts
Extra floppy drives
20mg Floptical drive
cordless mouse
about 20 boxed software titles including calamus and many other $$$$$ titles
ST Magazine collection
Hundreds of other legit commercial software titles
Programming books
all together, over 7 filedrawer-size boxes of STUFF over and above the computers.
PLUS Stuff I'm forgetting.

Also available: another 4 boxes of Atari 8-bit stuff including many carts, drives and 256K 800XL. Separate or with the ST stuff.

Make me an offer you're not embarrased to say. I'm in the SF Bay area.

EMAIL at ITSYAYA@HOTMAIL.COM (remove the NOSPAM if replying to this message directly).

Ive been having this problem printing legal on my ataris.
(falcon and 1040ste) my first printer deskjet 660 started acting funny
and completlety quit printing altogether so the good guys replaced it
with a new one which up to this point (5 days) has been fine.
but earlier this week (monday) i got in a used laserjet 5l.
at first it printed and eventually started giving me a double image
like if my page was like this
Gene
it rinted on the lj like this
Gene Gene(faded)
the selt test quit working (although i never knew if it worked when it came
in).
but heres the real problem
a freind wrote a small gfa program to set the 5l to legal. On his tt and
my ste it send the command and the laserjet light blinks to show it recieved
information. BUT the falcon does nothing. Although I checked the cables
and everything I could think of i run the program and it just wont get
the pjl code to the printer.

If anyone has a falcon and a laserjet will you email me so i can send you
the printer and see if it is in the falcon or is it just my falcon.
also If anyone can advise me please do.

gene

Erik, do you think that it would be valuable to have a list of wished-for features in a newsreading program? At the moment my list of "wants" spans all of the currently available progs but isn't completely satisfied by one alone. If you agree then it might be an idea to start a thread, it would then be up to you to decide which aren't easy to implement straight away.

I must admit I had some window blocking problems with STinG too. I've narrowed it down to having the dialer installed as an accessory. If I use it only as a PRG or APP, it works fine. As an accessory it seems to mess with mouse clicks. This occured with STinG 1.15 too.

The symptom is usually that at some point, mouse click events are no longer registered, drop down menus work, and you can see the mouse clicking on 3D buttons, but nothing happens and the only way out is to reset.

1149. Atari Mega ST4 Hardware

Newsgroup: comp.sys.atari.st
Date: 1999-06-25 00:00:00 UTC
From: Phoenix <phoenix@tscnet.com>
Message-ID: <37733113.ABE5528A@tscnet.com>
Source record: 76722

I have a Mega ST4, external drive case (w/ an ICD Host and a 50 Meg), If I remember right, the Mega ST4 has a 210 or 230 meg HD, an Atari Monitor, various stuff of all sorts (ie. Hayes external 14.4 modem etc). I used to run a very large warez ST BBS on it for years(the 1.2 gig HD is long gone). I went PC quite a while back and was going through my garageand found all this stuff. It was working when I put it away,, but I have clue now, it should be fine. I no longer want or need it. I was going to take it to the dump, then remembered there are people out there/here who might not appreciate that and would want it. So, I thought I might post a message here and offer it up. If you want it, send me an E-Mail at phoenix@tscnet.com .... I am not looking to get rich here, but what the hey, offer me a little for it and pay the shipping and it's yours. Better than going to the dump I guess. Best offer (that includes shipping to you from WA state Seattle area) gets it period. You can ask me a few questions in E-Mail also, but keep 'em simple. I have long since forgotten the vast amounts of ST knowledge I once had. Please only contact me if you are serious. I don't need the headaches. I just thought I would rather the stuff went to a good home rather than to the dump.... Cool with me... Cool with you?

The two times slower updates has nothing to do with the AB040, it's
an unescapable consequence of there being twice as much data per pixel.
The bus accesses would indeed be faster with a CT2, though (I'm not
sure it would really end up being faster, anyway, but that's of course
easy to check).

>>With the fVDI shadow buffer things would be a lot better on an AB040

fVDI will certainly do the same thing on your system, but whether or
not it will speed anything up depends on the processor and the RAM.

>>I've played around a good deal with my BlowUP Hard II, though, and the

...
>Then 'BlowUP' was the wrong tool, that's all. Like many others it will

Possibly.

>does work for the 25 MHz base clock, if the software is smart enough to use
>it. All you need to do is to use Videlity instead. (Now freeware.)

But 640x480x16bit@60Hz uses 35Mbyte/s, while the maximum amount the VIDEL could fetch on my machine was something like 30Mbyte/s.

>Theoretically it can be done even on a stock ST, except that it will

You mean Falcon, of course.

>then be heavily overloaded and bomb. Also, on an AB-Falcon you will

Hmm. Perhaps I haven't tried it since I installed the AB040. Still, the VIDEL should have priority over the processor, so things should be the same.

>>You need at the very least a Nemesis or a 15kHz monitor.
>
>No, that is not so. You need a software tool that can set up a pixel
>clock of 25 MHz for Hicolour mode, and make it work right. Videlity

I'll give it a try.

>(for colours >=16) as my normal 256 colour system palette. Thus JPEG
>viewing never changes any of my palette colours. Unfortunately I've
>never found any GIF viewer that will work the same way, using the same
>palette.

The window version of MGIF will be able to dither to any palette.
I'm not sure when that will be done, though.

>I didn't mean it like that. What I meant was your fVDI drivers for the
>NOVA card. I'd much have preferred to have the source for the 4 bit
>driver with Atari bitplane layout.

The only difference between that 'NOVA driver' and the FalconTC one is a #define in one file.

>>Since fVDI is (or rather will be) under the GPL, you can have the entire
>>source tree (except the mach64 driver, for now) if you like.
>
>I like. :-)

I'll get back to you (I'm going away for a couple of days).

>>No, currently fVDI always stays in the resolution you started it in.
>
>But on a Falcon that would mean you have to change NVRAM to switch fVDI rez

Yes, but the auto booting isn't really supposed to work very well yet for the normal graphics modes.

>Yes, but it is not fully realistic testing. One very important test is
>to see if the current AES (for multitaskers) and desktop can start up
>correctly, and then use fVDI correctly in the new rez.

Yes, but you only need to test that once or twice.

>>Again, testing of fVDI really should be done from the desktop, unless
>>you want to run below NVDI.
>
>Ok, gotcha, but I still think it is a little limited testing then.

It can test everything except the AES startup, which isn't too limited,
IMO.

>Whenever it can be used AMON is definitely the best tool for debugging
>AUTO programs and ACCs. But I doubt that it is '040-compatible...

There is a patch for MON itself, but I've not tried 'porting' it to AMON.

>>Due to the way the mouse routines currently work, even the non-movement
>>functions have to supply a coordinate. They do this by fetching from the
>>main workstation struct, which normally is perfectly fine (it is updated
...
>That fits my results perfectly. Is that in the 'global' part of fVDI, or
>in the separate driver code ? (Global I hope, so a single fix will do.)

It's in the global part (it could have been done separately in each
device driver too) and has now been fixed. A new FVDI.PRG can be found
in the /pub/fVDI/Beta directory on my ftp site.
(This one fills circles/ellipses/pies too).

>>fVDI doesn't know about resolution changes at all yet. Mainly because
>>it can still only load one driver.
>
>But that will have to change eventually, as rez changes are an accepted

Yes, of course.

>>Yes, that is the main thing NVDI does for screen drivers when it's 'on top'.
>>The fonts are rendered into a monochrome buffer which is then passed
>>to fVDI for mono-expand blitting.
>
>Ok, but for full compatibility some fixed colur will need to be added here.
>GEM is not specified to be limited to monochrome text.

That depens on what you mean by monochrome. NVDI on top of fVDI can
draw text in all the same colours that it can by itself, unless you're
using the current fVDI 16 colour driver.

>>When fVDI is 'above' NVDI, it doesn't let the latter do much at all.
>>Currently it passes the palette handling and in your case the mouse through.
>
>Plus the font handling mentioned above too, you mean ?

No, whith fVDI 'on top' you have no access to the NVDI font handling.

>>That is not the problem. fVDI is perfectly happy with any resolution.
>
>I've understood this from what you said further above, but this is the
>sort of thing I think should be changed to achieve better integration
>with how the system normally works. A VDI should follow rez changes.

Certainly.

>>However, I've not yet spent the time figuring out when those resolution
>>enhancers actually do their thing and/or what to do about it.
>
>I had to solve how to do this compatibly to multitaskers etc in LaceScan,
...

Thanks for the info and ideas.

>I'm not sure if fVDI is supposed to support gemdos/bios screen output

Not at the moment, but it will evetually.

Yep, another web to browse through, but this one's mine.
As well as some as yet unfinished pages this site contains pages on my tastes in music as well as a page for the ST and a Download page from where you can currently download yet another version of naughts and crosses for both the ST and PC and an small application which will let you know the TOS version, GEM version and amount of RAM fitted it the ST you run it on so if you have nothing better to then why not point your browser to...
http://www.fortunecity.com/skyscraper/pacific/888 (USA server) or
http://www.fortunecity.co.uk/skyscraper/silicon/88 (UK server)

and have a look.

You've probably already gotten an answer, but for what it's worth...

The power supply that came with my Golden Image floppy drive says this:

Model: WLE-D043
Input: 120VAC / 60Hz
Output: DC5VAT / 600mA

(Positive TIP)

Well, as you probably remember me telling you (when I sold you my copy of
ULTIMA 6), I have gotten ULTIMA 5 to run just fine from a hard drive, using a
little utility from an old ST Format (or possibly ATARI ST User) called
"DIVERT". It redirects programs that automatically look to drive A to any
other drive you choose. It really made ULTIMA 5 so much more playable!

I think I sent it to you, didn't I?

Sorry if my understending is wrong.
Does it mean that it is still possible to make Atari LAN based on MIDI?
Using version 1.15 it was possible AFAIK.

First, My monitor, is B/W!

My question is, WHy the HELL is the screen SOO small..
I'm not talking about the monitor itself, I'm talking about when I turn on my ST, the screen is like 1 inch above, 1-1/2 below and 1-inch on both sides inside a box... like it is really 30-40% smaller than the true size of the monitor..

Whats the deal with that?

Is the color monitor like that as well? I was thinking aobut getting one since you can't do anything with out one really...

I also need a hard drive and software! Anyone help me out??!? =)

Would you recommend the ST1040 for a computer, I have it, but I rather have a TT and dEF a FALCON!! =) (i wish!) anyone wanna do alot of trading for a falcon??=) I want one! =) heh...

but anyhow, any help would be appreciated!!

Thank you!,

Clint T

ps, anywhere on the web I can get freeware for the ST for now? or something, I dont even have a hard drive, heh.. but trying to make the most i can out of what I got!

Hi friend:

I would check different setups before asuming that the Falcon port is bad.
Fox example try printing from Calamus or Pagestream as they use their own drivers.
You could also and I would do this 1st, print to a disk file and then from the desktop send this file to the printer.
Also, try using a simple WP prg like Steno or Everest (very good) and just print a simple txt file. I have the feeling that you will get positive results :)

Raymond

1164. Amail v1.1 [from Atack]

Newsgroup: comp.sys.atari.st
Date: 1999-06-25 00:00:00 UTC
From: dziewon@xs4all.nl
Message-ID: <7l0dqcrgo1@news1.xs4all.nl>
Source record: 76737

Amail works under Magic and Sting! This is the first version - I tried
several earlier versions of Amail, but none worked sofar - and this
version 'even' supports the Polish ogonki [ISO-8859-2] which is no surprising
for a Czech programme! Have a try [Krzysztof are you 'listening']!

Gtx, Rein
Manual for aMail

```
.__.__
_____ _____ _____ |__| |
\__ \ / \\__ \ | | |
/ __ \| Y Y \/ __ \| | |__
(____ /__|_| (____ /__|____/
\/ \/ \/
```

v1.1 from 20.06.1999

aMail is a GEM mail client for receiving, writing and sending mails via
InterNET. Its main features are:

o fully mouse controlled GEM program, smaller memory requirements
than other "texts" programs ported from U*nix
o works with MiNTNET - it doesn't need other TCP/IP sockets or
o works with STinG/STiK too
o has fully U*ix compatible mailboxes - you can fetch your mails from other
system from work or school
o supports UUENCODE and BASE64
o supports MIME standard (you may save MIME attachments by drag&drop directly
into the desktop thanks to VA protocol; sent attachments have a set type
according to the file mime.types)
o ASCII configuration file, so you can edit it freely in a text editor
o you may define up to 25 mailboxes for sort your mail according to
given rules
o aMail hasn't own text editor - so you may use your favourite text editor,
but it must support OLGA protocol (QED, Everest).
o supports AV, FONT, XFSL and UFSL
o understands VA_START
o parse URLs in messages (using URLserver - an utility from ATACK)
o support Czech language and other iso-8859-XX charsets
o and more features that you can evaluate yourself ;)

#[cut,cut]#

We would like to thank all betatesters who shared their expensive time in
developing and helping with their suggestions and their advice. We want also
thank to Christian Felsch for his QED - a great text editor. All aMail sources
have been written with QED. And of course thanks to U2, Pink Floyd and

to Stones for the best music for programming ;)

If aMail doesn't work just write down what it does or not, when and where and the versions of your system components (OS version, MiNTnet version, AES, free RAM at a start of aMail, environment variables setting, ...)

Yours ATACK (InterNET division :)

1166. Proflight Atari 1.22

Newsgroup: comp.sys.atari.st
Date: 1999-06-25 00:00:00 UTC
From: jtmartin@tinet.ie
Message-ID: <7l0flc$di4$1@scotty.tinet.ie>
Source record: 76739

Hello all,

I am hoping someone might be able to help me with some problems I am having with HiSoft's Proflight software. I purchased the software as a present for my brother and he is having some problems with it.

The program version is 1.22 and the manual is the second edition, published 1991.

It seems that some of the keyboard shortcuts do not function as indicated in the manual. One example being autopilot - supposedly this is activated by pressing the [Alt] key, but this has no effect.

The software is being run on a 4MB 1040STe connected to a TV. I have also tried the program on my 14MB Falcon in both colour and mono modes and the problem persists.

Has anyone ever had this problem before, and do you know how to get round it?

Please reply to this post via email (jtmartin@tinet.ie) as well as posting, as the news server provided by my ISP does not seem to support this group very well.

Thanks in advance for any advice or help you can offer,

Jerry Martin.

1167. Code for Grandads Quest?

Newsgroup: comp.sys.atari.st
Date: 1999-06-25 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <7l0h8s$51o$1@nnrp03.primenet.com>
Source record: 76740

A few years back I mailed my money in to Ian Scott (I think that was his name) for the registration codes for Grandads Quest 1 and 2 for the Atari ST (2 of the best adventure games EVER for the ST). I still have the dark red code sheet for the sequel, but I lost the code for Grandads Quest 1, which was just a single 6 digit number (I keep thinking 153 something...) that I can't quite remember, and I lost the piece of paper that I had it on. I even saved it on a disk as a text file, too bad I didn't label the disk, because it doesn't seem to exist anymore. Argh, I really miss this game. If someone could be kind enough to trust me and send me the code I would appreciate it. Believe me, I have better things to do than act like I had some code I don't have. I tried writing a letter to the author (in the UK) about 6 months ago and got no reply. Thanks for any help you can give me. -Satcom2

1168. Needed: Macro Utility

Newsgroup: comp.sys.atari.st
Date: 1999-06-25 00:00:00 UTC
From: Ted Leonard <tleonard@netzone.com>
Message-ID: <hUPc3.952$G03.1890@news.goodnet.com>
Source record: 76741

I need a macro utility for the Atari ST which has the capability to record mouse clicks, and key stookes, and then allows them to be use when needed. I have used this utility, and believe it is an accessory (.acc). If you have a copy and could send it to me as an email attachment, or even if you could let me know the name, I could probably find it on the web.

Thanks for any help.

You can send a response to tleonard@netzone.com

Hi Jerry,

I've been using 1.22 myself for quite some years and never experienced any
troubles.... Make sure the A/P has one item to work on, i.e. either
heading/alt, selected target, selected waypoint or coupled approach (the
ILS thing). Furthermore I seem to recall that turning the A/P on and off
is NOT the ALT key but the INSERT key! Probably a typo in the 2nd edition,
I've got the 1st one over here...

BTW, IMO it's still one of the best-ever sims: apart from the graphics
it's unsurpassed regarding flight-dynamics and turbulence. Once you can
really fly this thing, try the combat modes...!

I dont have an RF port on my ST1040FM, so, else I wouldn't be asking
for help! =) heh...

dont know much about the kits, but interesting!

..and what I really need to know is, getting a Color monitor for my ST
, it still wont be dinky ass small like the mono one is?
yes ., its a SM124, =(, heh,, but anyhow!

I REALLY want a falcon!! =)
but, such as life..=)

Anyone wanna trade? heh, I got a LIST of stuff!

thanks for you help man!

appreciate it!

Go back to V7.12 up to V7.55. The latest I have is V7.56, and it seems to have problems with the SCSI devices on my A/B machine (but not my Mighty Sonic). You can also try with your version to run it from the autofolder as well (as HDDRIVER.PRG). I think versions from V7.12 allow this. This was a commom problem on the Afterburners, but I don't know what changes have occured with newer versions of the driver. Anyway, try running it in the autofolder after any special CT2 drivers have done their thing and see what happens. A good place is last in the autofolder as long as you don't access the SCSI drives during bootup. If that doesn't work, I would try an earlier driver.

If you have upgraded to the latest ExtenDOS, try putting the old CD.BOS driver in the driver path (for ExtenDOS). The only way that I have been able to utilize the latest version is to load it BEFORE fast ram is allocated. I would think the CT2 is a little more advanced than the Mighty or A/B and loads the fast ram with instructions from ROM, which will make it impossible to load ExtenDOS before the fast ram is allocated. That case, use the old CD.BOS. If fast ram is loaded with a driver from the autofolder, just run ExtenDOS first in the autofolder. (don't whine about boot managers, I don't use them:).
Flag settings didn't seem to matter to ExtenDOS or the drivers. It had to be run before fast ram was installed. Period. ExtenDOS Gold and the old drivers from V2.4(?) work fine with CD Writer for burning audio CD's, but I don't have the latest upgrade to burn data CD backups to test that.

Let me know how that works. Will save me time when I install my CT2. Girl friend is pissed off, so it may be sooner than I thought.....

1177. How to make Supra HD work

Newsgroup: comp.sys.atari.st
Date: 1999-06-26 00:00:00 UTC
From: David Tyler <softshare***@yahoo.com>
Message-ID: <37746FAF.AEAE6ACA@yahoo.com>
Source record: 76660

I just bought a 1040STf (I owned one years ago, and wanted to have one again for sentimental reasons). It came with a 20MB SupraDrive Hard Disk that plugs into the HD port (ACSI?). No software came with the computer.

When I power up both, all the lights come on, on both the Atari and the Supra drive, but no icon appears on the desktop. I'm guessing I need a driver of some sort.

How do I read the Supra drive? Where can I get a driver?

Please reply to me directly. Just remove the asterisks from my e-mail address.

Thanks!

David--softshare***@yahoo.com

>First, My monitor, is B/W!

Don't get rid of it if you want to use serious modern applications on it! Colour monitors run in lower resolutions which aren't up to a lot of modern software.

>My question is, WHy the HELL is the screen SOO small..
>I'm not talking about the monitor itself, I'm talking about when I turn
>on my ST, the screen is like 1 inch above, 1-1/2 below and 1-inch on
>both sides inside a box... like it is really 30-40% smaller than the
>true size of the monitor..
>
>Whats the deal with that?

It's normal for STs. You get a border on colour displays too (white, rather than the black you get in mono). Not sure of any technical reason for the border, but it does keep the active screen away from the corners of the physical screen where you can get quite bad distortion on older monitors/TVs. Mono monitors tend to be used for things like DTP so minimising distortion is important.

>Is the color monitor like that as well? I was thinking aobut getting
>one since you can't do anything with out one really...

Nope: colour monitors are needed for most games, and are obviously better for some applications such as graphics. Everything else will be much better in high res on an ST: the higher resolution (and therefore effectively bigger screen) more than compensates for the lack of colour.

>I also need a hard drive and software! Anyone help me out??!? =)

For this kind of thing, check out links from the quick FAQ (http://quickfaq.atari.org), particularly the link to Hallvard's Atari launchpad.

>Would you recommend the ST1040 for a computer, I have it, but I rather
>have a TT and dEF a FALCON!! =) (i wish!) anyone wanna do alot of
>trading for a falcon??=) I want one! =) heh...

1040s are great, especially if you take the RAM up to max (4Mb without serious surgery) and add a hard drive and modern multitasking OS. If you aren't that bothered about games and older software, then a TT or Falcon would be better. If you want to do graphics stuff and don't want to shell out on a graphics card, go for the Falcon as it has better graphics capabilities in its vanilla form.

>ps, anywhere on the web I can get freeware for the ST for now? or
>something, I dont even have a hard drive, heh.. but trying to make the
>most i can out of what I got!

Check the links from the FAQ as mentioned above. Hallvard's Atari launchpad
and the UTSI should give you more pointers than you can use immediately!

It's typical error of SM 124 mono monitor. Usual reason is that
electrolyte capacitors loose their capacity. You should carry your monitor
to service.

Pera

> information is displayed correctly.

Hm, suprise..
I think your chain works well. Canï¿½t say how the problem is.
I only know that with some old devices.
Here, all works fine, all modes.

> But, when ExtenDos Gold runs from the Auto folder it reports
> a ERROR Drive Not responding for the CD Rom and CDR drive.

That also works fine. Connected three CD devices to my falcon.
(One of is realy old.. (XM4101)

Any chance for an driver configurations missmatch?
Sure you are not have extendos and metados active to the same time?

Remove memory flafgs from program header?
I only use "fast load" for extendos.

> Why doesn't HD Driver work with any of the SCSI drives in the Turbo
> Modes?

No idea.

> And why does ExtenDos Gold report a Error drive not responding with
> the CD Rom and CDR drives in turbo mode but not in normal Falcon mode?

I think if extendos do that, one of your devices doasnï¿½t respond well in
turbo mode. Not the first one..
Sure works fine in normal mode, but not in turbo mode.

> I have e-mailed Centek and am waiting for a reply.

They answered: remove old devices.. :/

> Does anyone in here have a Centurbo 2 version B that knows if
> any version of HD Driver does work in the Turbo Modes?

thomas_steuer@of2.maus.de
Ask him.

> If so, how do you have it configured with the CT2B setup menu.

No. I made this for thomas. The one an only i made:
switch from "cecile" to "external"
All other setings exactly the same as for cecile.

> Do I need to set programs such as HD Driver and ExtenDos Gold
> to run in FastRam or something like that?

Canï¿½t remeber me to set any flag new..
Use only "fast load" for extendos!
Check if any of your autofolder prgs are not use the fast load flag!

Thatï¿½s all for the moment. Too early here.. 6:25am ..

Regards, Robert (StarGate on IRC)

Videlity works on the same way as the SBII / IIIsoftware.
Videlity supports only the same hardware since the first release.
Any they are all older as CT2..

If you want to format a 1.44HD floppy as 720k then you
just have to tape over the hole that is on the right hand side
when the floppy is label side up - If I remember correctly.

Hope this helps.

Boing

But beware - the 1.44 floppies require higher write currents than the 720Kb
variety. While you may be able to write to 720Kb format in the above way
many peopple find that the data, so written, disappears over time!

1189. Free Gemulator98 - STiNG - Port speed?

Newsgroup: comp.sys.atari.st
Date: 1999-06-26 00:00:00 UTC
From: kennethm@tripnet.se
Message-ID: <3775116a5a43c43@tripnet.se>
Source record: 76672

I just tried to set up STiNG 1.20 with the now free Gemulator-98 emulator. Prievious versions did not work but this time everything runs perfectly! Also tried BNET and FTP_SERV running with Geneva and no problems at all. This version is _not_ a demo with memory limitations, etc.

There is a setting in the Gemulator setup form for using "Fast baud rates" but I have not been able to figure out how? I did try the "hsmodem way" with very low bps simulating higher ones but this did not work. Any clues?

1190. Updates, anyone for another one?

Newsgroup: comp.sys.atari.st
Date: 1999-06-26 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <37750b9c100ca740@holleman.demon.nl>
Source record: 76673

Hi,

somuch for all those updates...

Martin's announcing another StarCall one and a new aMail one, while Rein shouts that the new aMail works flawlessly...

So I fetch them both and install them.

aMail: now it won't even encode MIME or UUE, it won't send mail (that was OK before) and I know that's on MagiC, but 1.05 was a better one for me.

StarCall: the new one works OK, though at configuration it autotests the ports and reports "no modem connected" to all ports.

The problems start with StarBox. On several menu-selections it hangs, for instance when you want to set the file-protocol as a logged-in user... When I want to D/L a file as user it cannot find the modules. My config is 100%....

So much for this English version, I go back to my 2.0 german with the BBS menus in german too.... at least that one works...

BTW, I nearly escaped disaster last week, when I started up again after returning from another mode and the desktop didn't show up OK. Set Thing to "reload settings" and the same stuff. Thing.inf and another one showed 0 bytes! Checked the partition (C:\) and filled up to the top! I cleaned up much of Cab's cache, Thing's cache and C:\new and got another 35 megs free again. Lucky enough I had been backing up the whole bunch of basic system to a 44 meg Syquest cartridge recently, so I could get the latest inf. files back. The rest was undamaged, even while X-Boot had been running :-) Needless to say, just in time!

1191. MSA ?? help.....

Newsgroup: comp.sys.atari.st
Date: 1999-06-26 00:00:00 UTC
From: liberator@acsplus.com
Message-ID: <7l3bha$6fs$1@nnrp1.deja.com>
Source record: 76674

I'm obviously new to this ST stuff, but
I know extensions with MSA is like to be put onto a disk, kinda like
being unzipped right?? One problem? How do I do that?

I have an IBM PC, and thats the way I carry programs over to my ST1040
but I only have the internal 720k in it, and need something that will
extract the msa onto the disk? If there is such a thing for the IBM PC?!
Any help or info would be greatly appreciated!

Thank you in advance,

Clint Thompson

I have had no succes with StinG 1.15 either, I tried that once and it
wouldn't initialise the link, just kept on bombing out.

I've tried it both as a ACC and PRG with Geneva but no success:-(

But as I don't really like using Geneva with Sting ect; I really need
the ACC to work.

>The symptom is usually that at some point, mouse click events are no

That's is also my opinion. I haven't used MIME or UUE yet with this
version but looking at the "write mail box" I notice that I can't select
the UUencode option.
There are still some annoying bugs and shortcoming inside aMail.
Why isn't there 'sig separator'?
Why doesn't hold aMail the queued mail after a reset?
aMail still uses a two character year indication in his header instead of a
4 digit one.
etc..

>StarCall: the new one works OK, though at configuration it autotests the

You're better off then me then. Starcall hangs randomly on my system. I
think it doesn't like MiNT.

I have two SyQuest EZflyers (230 Mb) connected in tandem to my
1040STe via an ICD LINK 2. But I had to put a terminator between the
LINK and the first EZFlyer--I don't know why. Lately I've added a ZIP
250 Mb at the end of the chain and they're all working happily with
the ZIP interminated. I did have a terrible time getting this setup
to work at first but I think I made some serious error early on. I
added the ZIP only because SyQuest is out of business and I wanted

some insurance against an EZF crapout.

Originally, I bought the first EZF as a backup to a larger SCSI drive
that did crapout. My HD capacity needs are very modest.

1195. FA: 80s computer mags (Atari, Creative Computing, others)

Newsgroup: comp.sys.atari.st
Date: 1999-06-27 00:00:00 UTC
From: "Marc G. Frank" <mgfrank@yahoo.com>
Message-ID: <7l648nuvm1@nnrp1.deja.com>
Source record: 76595
Cross-posted to: comp.sys.atari.8bit,comp.sys.apple2.marketplace,comp.sys.cbm,comp.sys.atari.st

I have several lots of mostly-1980s computer magazines for auction on Yahoo. They don't have reserves and sort of open at a penny; however, there's a handling fee unless you want them shipped via Priority Mail, which is feasible for small lots but not so feasible for the 61-pound monster lot of Antic magazines. :-) They can be seen at:

http://auctions.yahoo.com/user/mgfrank

Lots are:

* 53 issues of Creative Computing magazine, including some April Fool's issues
* 7 issues of Compute! magazine
* 14 issues of Family Computing (also includes an issue of Popular Computing and an issue of Home Computer magazine)
* 4 issues of Softside magazine. These might interest Infocom fans. One issue (with a detached cover, unfortunately) has reviews of Suspended and Zork I and an interview with Marc Blank and Mike Berlyn.
* 5 classic videogame magazines, sadly mostly in poor shape. 3 Electronic Gameses, 1 Videogaming and Computergaming Illustrated, and 1 Computer Entertainment
* 4 issues of Current Notes (Atari)
* 7 issues of Compute's Atari ST magazine
* 5 APX (Atari Program Exchange) catalogs
* 55 issues of Analog (Atari 8-bit), including earlier, hard-to-find issues, such as all of issues 1 through 25
* 113 issues of Antic (Atari 8-bit). Lots of dupes, unfortunately, but also many early issues--volumes 1 and 2 are complete.
* 29 issues of STart magazine
* 24 issues of ST Log magazine

I've also got two ST games up (Questron II and Dungeon Master) and the C64 Programmer's Reference Guide.

I'm trying to get rid of these with minimal shipping hassle, which is why they're in such large lots and why I didn't sort out the dupes into separate lots. Enterprising collectors may wish to fill in the holes in their collection and auction off the rest one issue at a time.

Thanks for looking!

1197. Lots of questions on MagiC, Gemulator, MagiCPC

Newsgroup: comp.sys.atari.st
Date: 1999-06-27 00:00:00 UTC
From: Grings <gringsX@Xbigfoot.com>
Message-ID: <9Yxd3.745$C4.537@news.indigo.ie>
Source record: 76597

Hello there,
for the past few years I haven't really used much TOS software except a few classic games with PaCifiST or Winston. Mainly, because none of the free emulators were any good at running apps.
However, since I downloaded the new version of Gemulator 98, I finally have something which can run GEM program at a good speed. Admitably only in 16 colours but 800x600x16 is a lot better than my ST could manage!
Since I have a 450 Celeron, Gemulator is fairly quick. (However, the CPU core is nowhere as quick as the '040 core of Executor or even Fusion or Basilisk.)
I'm currently running MultiTOS which is quite useably unlike on a 8Mhz ST. I finally got it working with an alternative desktop (the crucial detail seems to be to leave an extra RETURN at the end of GEM.CFN).
However, when using the built-in MultiTOS desktop, if I assign lots of Icons for different files etc, the NEWDESK.INF seem to get corrupted. Is this a bug or is there buffer setting or something in MINT.CFN?
I used to have some copies of ST Magazin from around the time of MultiTOS's release which documented all the various options in MINT.CFN but I no longer have those mags. Is there a online FAQ for MultiTOS somewhere?
I know that MultiTOS seems to have disappeared and that most serious people are probably using MagiC nowadays.
Speaking of MagiC, I also downloaded the demo of MagiCPC from ASH recently. The demo version from 1997 supports VFAT (Win95 compatible long filenames) which is quite impressive. However, it is about 10% - 15% slower than Gemulator. I noticed on ASH's homepage (http://members.aol.com/ashinfo/aktuell.htm) that there is a new version 6.1 release of MagiCPC dated April 1999. However, their web page gave no details. Does anyone know what the enhancement are? Does it run quicker and does it emulate an '030+?
Returning to Gemulator, is there any program like HFV Explorer for reading/writing .ST, .MSA, .VHD (Gemulator), .MPC (MagiC_PC hardfiles)? I know about Gemulator Explorer but that doesn't allow writing to the volumes.

Finally, has someone done a proper benchmark / speed measurement of Gemulator et all? Gembench says that on my 450Mhz Celeron, Gemulator scores 300% of a Quadra 630 (33Mhz 68040) which doesn't seem right. I've used MagiCMac on a IIci and it 'felt' quicker... Certainly Gemulator doesn't feel like it's running on the equivalent of an 100Mhz '040.
BTW, I was always one of those who considered TOS program to be every efficient as regards RAM and CPU power. But once you try running things program like Ease or a font-scaller etc everything quickly becomes bogged down. In fact, I'm beginning to think that on equal hardware, Win95 or MacOS wouldn't necessarily be quicker. That's not to say that individual ST program aren't really quick and optimised; for years I did all my WP on an

ST using Tempus Word Junior and it really did fly - MS Word seems to need at least an 100Mhz Pentium or so to equal that speed.
Having said that, TWord didn't support scaleable fonts or proper copy and past. And, the last I saw it advertised, if cost over 500DM which is a lot more than MS Office (I've seen Office 95 for about ?40).
Thanks for reading this.

1198. CLI program for STalker Remote mode

Newsgroup: comp.sys.atari.st
Date: 1999-06-27 00:00:00 UTC
From: au576@lafn.org
Message-ID: <1999Jun27.224019.19304@lafn.org>
Source record: 76598

I am using STalker and a null modem cable to transfer file between two of my atari computers. I am using Tom Shell for the CLI, but am wondering if there is something better for manipulating files remotely. I would like to move folders along with subdirectories like on the desktop, but the CLI shell will only move files without folders (e.g. copy d:\stalker*.* e:\ will not copy any folders contained in the stalker directory).

Is there another CLI I could try, or maybe a TOS copy program I could run from Tom Shell to do this? it would also be nice to completely delete a non-empty folder.

Errmm, beats me! Two blank lines would do nicely :-)

>aMail still uses a two character year indication in his header instead of a
>4 digit one.

That way at least it's Y99 compliant... :-)

>etc..

Right, why are the texts on the icons in the toolbar that tiny? Need a
magnifier to read them. Yup, I can set an 8x16 type for small ones, but
that's not my cup of tea... Or... make the text show up in black!

Martin, the docs state it's Multitos compatible... maybe not "Hades-
compatible" :-)

BTW, I managed to get the new StarBox working OK. Appearently the settings
had to be reconfigured by using Starpoin.prg... all formats have changed.
All the descriptions of files in my boards show up with "no information"
now so I've gotta edit all the boards again... But at least users get
decent English menus now :-)

1203. HD Driver 7.xx

Newsgroup: comp.sys.atari.st
Date: 1999-06-27 00:00:00 UTC
From: leaver@dynamite.com.au
Message-ID: <7l4ioo$13b$1@black.interact.net.au>
Source record: 76679

I'm still trying to get HD Driver v 7.71 to boot reliably with Magic.

I have observed a small curiosity which probably had no bearing on the matter but for which someone may have an explanation.

Beacuase my internal drive is a Quantum Fireball, I have HD Driver on an external Seagate which was the original drive in my MSTe. The HDDRUTIL.APP v 7.71 shows this drive as having switchable "Unit Attention". The v 7.00 shows the option blanked out. Both can't be right.

Any ideas?

David

David Leaver 10 Goodparla St,

1204. 720k bare 3.5 Epson SMD-286 floppy drives for sale.

Newsgroup: comp.sys.atari.st
Date: 1999-06-27 00:00:00 UTC
From: martin.w6@ukonline.co.uk
Message-ID: <3775e73b.10396470@news.easynet.co.uk>
Source record: 76680

They look identical to the Falcon's internal Epson drive as
they have the same front but they are only Double Density.

Instead of beige the front is a charcoal colour. They're
almost as new.

All tested.

I have five up for sale or swop.

Price each is £10 including insured postage.

Always consider swops.

Also I still have a few spare Floptical disks. £3.50 each or
5 for £15.

Lastly a plain 520STFM with joysticks and lots of games plus
colour monitor £65 including postage.

Amiga 500 1MEG plus colour monitor, printer, slow modem and
lots of games £100 inclusive.

Again always consider swops.

1205. Technoplus Rockwell based external 33.6k modem (boxed) for sale UK £25 plus £3 towards postage (unless local to me)

Newsgroup: comp.sys.atari.st
Date: 1999-06-27 00:00:00 UTC

Source record: 76681
Cross-posted to: uk.adverts.computer,uk.adverts.computer.mac,comp.sys.atari.st,comp.sys.amiga.marketplace,comp.sys.acorn.misc,alt.acorn.adverts

Atrractive compact design. Mainly metal construction in silver (so well shielded).

Has full voice facilities including necessary sockets including a BT type socket for your phone to plug in.

Fully approved.

Has been used with PC, Acorn, Amiga, Atari ST/Falcon and Mac with no problems at all and regularly connects at 33.6 with easynet or UKOnline. Occasionally goes down to 31,200 (not due to modem of course)

Totally stable. I used it for 13 hours (when Skydial had that all day offer on) and that was a long distance connection. I only disconnected because someone needed to use the phone.

Choice of lead;

shortish type with both 9 and 25 pin serial connection for computer.

longer lead with only 9pin connector.

or alternatively I can supply the bits so a mac user can make up his own cable. I have the pinouts but don't have the time to make it myself.

Its also a full fax modem and comes with manual and drivers disks which includes a full PC package for automating your phone system.

Download speed for compressed files like zips is a maximum of about 4k per second (just under)

Will also consider swops of anything computer or console related.

Stuff I'm after;

nice Amiga 600 with 2meg expansion and hopefully small HD.

32x with games.

IDE or SCSI hard drives 750MEG minimum 2.5 (not scsi) or
3.5.

I know it's bad form to follow up one's own posting but....thanks very
much to everyone for their help, advice and technical info!

I have found 2 Musteks Scan Express models, a 6000P and a 600CP both
retailing at 40ukp which seems very reasonable for 300 x 600. I've yet to
sort out the difference between them.

he won't get a chance to be as it ain't bin cracked for the Atari,but
that said I would gladly have used a cracked copy after contacting Emagic
to try and buy a copy so I could continue on my falcon where I left off
on my STE using Notator SL,I was told it was no longer for sale for Atari
and that I should ditch the old fashioned system buy a PC and then trade
up to Logic ,I spent over a year trying to locate a second-hand copy
which is hard as Emagic's policy on a cross platform upgrade is to
destroy the handed in dongle,so if this bloke really needs Logic Atari I
feel pity for him,maybe an explanation like this would have been better
than just "anyone got the crack"

Well I've read the instructions (the manual says you need to install
your TOS ROM's into the ROM card before using Gemulator!) and browsed
the CD and haven't found any likely looking suspects so far.

Anyone know the name of such a program (for dumping TOS 3.06 ROM's to
disk)?

The superdisk can read low density (720K) and high density (1.44MB) Dos format disks, along with high density Mac HFS disks. It cannot read low density Mac disks (800K).

All,

As I seem to be running short on free time, Diamond Back
and Diamond Edge development have taken a lower priority.
Unfortunately, I don't see much of my time freeing up the
near future.

Therefore, rather than letting them sit around, I'd like
to auction off the exclusive copyright and source code to
Diamond Edge and Diamond Back.

You'll receive the original source code, the re-organized and
slightly updated source code that I worked on (probably one or
two hundred hours worth), and about anything else that was shipped
to me from Oregon Research.

Note: you'll need Lattice C.

Email all bids to michael@fastlane.net

Thanks you.

I do not have the time at the moment to do the newsreader.
But it will come when i have done some other changes in the program
to make it more easy to add this newsreading functions.
Lots of the newsreading basics are already in the code but the user interface is missing.

/Erik Hall

You could try a faster serial port and either a graphics card (the Reflex
card is good if you can find one second hand) or a resolution expander such
as LaceScan http://dlanor.atari.org :-))

You may want to set up tcp/ip with STinG on both computers and run the
client/server BNET. It will let you access the remote HD direct from
the desktop and from within any program.

You will need a multitasking AES (Geneva, Magic, etc) for this to work.

Indeed, they can't. Version 7.7 should be right but this setting doesn't
make a difference as long as your TOS is not older than TOS 1.04.
Anyway, you can simply switch it off.

> both sides inside a box... like it is really 30-40% smaller than the
> true size of the monitor..

That was a deliberate move from Atari. The idea is that everything is the same size when on screen and on paper printed from an SLM laser printer. If you enlarge the screen image, you will lose the 1:1 ratio.

Anyway, there are files around the net describing how to enlarge the image on an SM124/125 monitor.

> Whats the deal with that?
>
> Is the color monitor like that as well?

Well, there is a border around the screen. All computers of that era had that, mainly because of the fact that the display had to cope with TVs. There is also a hardware mod that can be made to STFs to acheive overscan, but really what use is that. You get used to it after a while.

> I was thinking aobut getting
> one since you can't do anything with out one really...

Erm... It's more the other way round really. You can only really play games with a colour monitor, but for any serious work, you really want a mono screen. Don't forget that high-res and colour are mutually exclusive.

> I also need a hard drive and software! Anyone help me out??!? =)

> trading for a falcon??=) I want one! =) heh...

It depends what you want to do with it. You say you want a colour monitor, therefore I assume you only want to play games. In this case, you don't need a hard drive or a more powerful machine. If you plan on doing any serious work then you will appreciate having the extra horsepower, and a hard drive.

Hey, up until last year, I didn't have a hard drive either, and you can
really cope without one.

Check out the Quick FAQ and the UTSI, and then the usual FTP archives
around the net.

Yeah, but if you have a SCART connector on your TV you can hack a SCART
cable.

> dont know much about the kits, but interesting!
>
> ..and what I really need to know is, getting a Color monitor for my ST
> , it still wont be dinky ass small like the mono one is?

Why don't you get a 17" VGA and plug it into that. Don't forget that
whatever the size of the screen, resolution will always be 640x400, so
having a larger screen will only mean having larger pixels, not a larger
workspace.

> software or disks.

You need to use 720K DSDD floppies. In most cases 1.44Mb ones will work,
but these are much less reliable (although some will probably say
they've been using them for years). Don't trust them.

If you want to use 1.44Mb floppies as such, you'll need to upgrade the
floppy drive, install an Ajax chip, and perform a few hardware
modifications on the STF's motherboard.

This is detailed in the Quick FAQ.

> Please copy me on your reply. Just remove the asterisks.

Sorry, can't be bothered.

This is a bug in the AES. The newdesk.inf is limited to 4Kb. If it get's
any bigger you need to run a patch program, but I can't remember the
name. In the sake of simplicity, keep it below 4Kb or use an alternative
desktop.

> I used to have some copies of ST Magazin from around the time of MultiTOS's

> are probably using MagiC nowadays.

Actually, MultiTOS is MiNT with an AES. You'll find a lot more support
nowadays for MiNT, which is free, compared to MagiC which is proprietary
and commercial.

> driver of some sort.

Normally, if that drive used to be connected to the ST, the it should already be set up. Try just creating a new C icon the desktop to access it.

Sometimes, the ST doesn't see the drive because it hasn't had time to spin up to speed. You should try switching on the drive, waiting 10 or 20 seconds or so, and then switch on the ST.

> How do I read the Supra drive? Where can I get a driver?

If all else fails, get the complete AHDI package from:

http://www.multimania.com/bales/ahdidisk.zip

Don't forget to create your C icon, and then save the desktop!

You have to _install_ AHDI onto the drive, using the Hard-Disk
utilities.

Looks like an module that contains eproms, roms or some other
electronic, maybee what a dongle contains.

Try to create "c:/" on your desktop (Eprom moduls are use the smal c:)
(Kapital "C" are for hard drives)
If you got nothing, i think iti¿½s an dongle for xx music software or some
else.

It's not sure, that it will work. Especially with newer digital monitors.
I have 15 inch one, and it works not, because Atari hasn't accurate VGA
frequency. Perhaps some older mono monitor will work, if you will be so
happy to find it, and make adapter.
Btw. on most cheap mono-VGA monitors ST forks fine in high reslolution,
and I think that it's enough for 640*400. Even with some border.

Pera

1242. Keyboards and pinouts

Newsgroup: comp.sys.atari.st
Date: 1999-06-28 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <37777fbc2eb728b0@holleman.demon.nl>
Source record: 76625

Hi,

well, my keyboard (TT) IS degrading fast now. Can hardly type an "l", the spacebar works badly and the enter thing lost its contacts permanently.

Next saturday I'm gonna get a Mega-STe, at least it comes with the same keyboard as the TT's, but I've got two STf's, one is in working state and is used to run old stuff which won't run from the TT, the other one is a spareparts machine.

The STf keyboard is connected by means of a 7-pin connector. The TT kbd has a 6-pin connector.

I figure, the 7th pin (the yellow cable) on the STf kbd is for power to the leds, so the other six (black ones) should be the same ones as the 6 pins for the TT kbd. Am I right?

I've been trying to cut one paperclip into 6 small pieces of pins and connected the six pin connector on the "phone line from the TT kbd socket" to the six black pins on the 7-pin connector from the STf kbd... but the mouse wouldn't move, nor the kbd beep. Next I reversed one of the connectors and the same stuff. So basicly now I have the question: how to connect an STf kbd to a TT kbd-cable???

I already converted one of the STf casings by hacksawing the keyboard front part off, so it can contain the kbd unit and be connected to the phone line cable of the TT's kbd, but the pinout remains a mystery...

BTW, typing "l's" using the CTR-V feature in QED is faster than ramming around on my "l"-key, but one's gotta get used to it... :-)

Another BTW: any decent way to take apart the kbd-unit from a TT, getting to this mylar-thing without breaking all the plastic studs which keep the metal piece in place? Looks like a helluva job to me...

>when the floppy is label side up - If I remember correctly.

No, that's not mecessary. Remember he has a standard STFM which will
have only a DD drive fitted, so the HD hole will do nothing. Even if the
drive has been replaced with an HD one, unless a hardware mod has been
undertaken to speed up the clock the drive will only work as DD.

Also, there have been reports that formatting HD disks to DD on a DD
drive is not a good idea for long-term storage. Possibly this is due to
a higher writing current being required for the higher coercivity
coatings on HD disks.

Regards, /Peter/

Yes! I would say Atari Computers ARE back.
There is no need to translate that page, just go to
http://bengy.atari.org/milan.htm for all the same, <more accurate>
information. Furthermore, Tonight I am adding an interview with Milan
Cofounder and he explains it all.. it is ALL very very very exciting :) I
will post a message late announcing when the Interview is online.

I actually own an OFFICIAL copy of CREATOR which I paid £250 for
a few years ago. Like Kevin when I contacted Emagaic to upgrade to Logic
they said it was too late and they weren't doing any Atari stuff any more.
Which is interesting because when they were just coding for the Atari
platfrom I contacted them and asked if they were going to port
Creator/Notataor
to the PC platform. Not on your life was what they basically said. How short
sighted and up there own arses they seemed. So the only ways I could think
of getting hold of one was a) second hand...I haven't come across one
or b) a crack....haven't come across one.

So Steve Sweet, is listing your spec a bit of like measuring the size of
your member
you sad person.

Thanks! It's all coming back to me now. I had been using the ICD tools. But since my ICD host adapter died, I had to switch over to AHDI. I never had to use the AHDI tools to set auto boot before.

Everything is working fine now!

I finally figured out what causes those. Turn off 'Fast Graphics'. Seems
that option patches the actual 'memory' ROM (not the disk image).

Not that it does any harm. I wish I could turn off that awful memory test /
HD timeout though.

Source record: 76496

Hi,

I just got an upgrade to my NVDI and its ver 5.2. I have installed with no problems. however, I only have one small program that uses GDOS and it now no longer recognizes NVDI as my GDOS as ver.3.02 did. I also cannot access the Printer config CPX that came wtih the upgrade. When I try and execute this CPX it list about 5 different 'Illegal AES calls'. I use a TT, 4ST/16TT ram, Crazy Dot II board (ET4000), Geneva. Any ideas?

At present I have gone back to my NVDI 3.02 which works well.

> hard enough?

You looked hard enough!! The modem on iMac is a Mac 'standard' RS-422
connector, although it is possible to go from RS-232 to RS-422 using
a bit of soldering iron 'mongering'. I have succeeded in making an
RS-232 talk to an RS-422 (Falcon030 to PowerMac) but speed was limited
severely. RS-422 to RS-422 worked very well in comparison (1MB in 35-40
seconds from Falcon030 to PowerMac).

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi there,

Martin Wilson wrote:
>
> They look identical to the Falcon's internal Epson drive as
> they have the same front but they are only Double Density.

If anyone has a dead floppy in their Falcon, look at any old
386 PC's sitting around. The original Epson SMD-300/340 FDD
is old enough to come from 386SX days. Considering Falcon030
arrived 4 years after I saw the first 386SX, its pretty low
that Atari could stick 4 year old ex-stock floppy drives in
new Falcons...

Anyway if a 1.44MB disk dies in a Falcon, look for old 386's.
Epson drives are VERY common in those...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

I've have problems with the CPX as well. If I remember right, it is a problem with WDIALOG.PRG. I think there is an upgrade to that applicaton on the ASH web site. I just checked and I am using V5.0 of NVDI and the printer CPX is working. I'm in single TOS, so I can't jump back to check the version of WDIALOG, ATM.

What applicaton is not seeing GDOS now?

It's still B&W only ATM, but Nima has said that he's working on adding
colour to this facility.

The latest version of ScanX Pro adds the option of rescanning the SCSI bus
should you decide to scan something but have forgotten to turn the scanner
on before booting. I find that there's a problem with this and my CT2 as I
get a 68000 exception error tho'. My present workaround is to make a Spawner
data file which runs Steffen Engel's SCSIDRV.PRG and then the scanner
driver.

After registering and using GEMSpooler I found a better answer to the
printing problem with Nemesis was the printer speeder iPRN. I've now
registered the MagiC XFS version and that was equally as effective.

I wouldn't like to sound to negative, but don't some of the specs of
this computer sound a bit strange:
- When did Motorola start making an 80MHz 060 ?
- 3 serial ports ? Why not, but also why ?
- What the heck is a PS/2 Logitech _Atari_ mouse ?
- Why provide Iconnect without CAB, but with Draconis ?
- What use is ACS Pro (a GFA library) with Omikron Basic ?

I'm using Zero X with a Falcon and it loads ok but when I load a sample it locks up and shows an error message. Then I reboot the program and it runs fine from that point on. Whats going on?

Our iMac has a built-in 56k modem, and no external serial-port of any kind (apart from USB, but that doesn't help much). It looks like the only way to transfer something from a ST to an iMac without additional hardware on the Mac-side would be to hook up a modem to the ST...

Lots of interesting stuff there :-) But you forgot to ask him the most important question: Why did they use the 060 instead of a cheaper and much faster PPC? It would even be more compatible than the 060...

Also, he claims that it "feels" as fast as a 300MHz Pentium. I really hope it feels faster than that, even my Falcon/Afterburner *feels* faster than the Celeron@450 I had ;-)

Amen to that... my stupid old TT *feels* nothing slower than a P-166 or 133, even the Vectra-400's only *feel* slightly faster than my TT. Except for handling JPG's, the decompression goes faster on Intelboxes. But lotsa things don't go faster on those recent "supermachines". I dare say that my TT boots faster with the bloody whole bunch than booting a P-166 with bare Win-95 alone... and we provided all those oldies with 24 or 32 megs to speed up things...

Probably an overclocked 060. Amiga geeks are hot on this topic with
modding thier Phase 5 060 accelerators.

> - 3 serial ports ? Why not, but also why ?

Probably for the lack of reliable USB compatible serial adapters. I
also didn't see any references to MIDI ports, so the more the merrier
for external MIDI boxes.

Probably because they have the experience of the Apple and Amiga
migration to the PPC platform. The 060 can be used without significat
recoding of the OS or reengieering of the hardware. The PPC requires a
fully supporting OS, or you get what the Mac suffered in the
transition- 68k emulation by the PPC resulting in less than
satisfactory performance in the initial models. It took them close to 4
years to move from the 68k dominant OS 7.5.5 to the PPC only OS 8.6.
The Amiga requires one of two alternate OSs (WarpUp and one other I
can't remember the name of at the moment) running in parallel to the
AmigaOS to utilize the PPC upgrades put into thier systems.

And FWIW- the 060 uses a lot less power and puts out a lot less heat
than the 040s ever did. And perhaps the PPC would be overkill for an
efficient OS like TOS.

Since they've obviously reengineered the Milan anyway they could IMO just as well have gone the PPC-route. As for the OS... Well, you obviously can't boot TOS directly, but you can get a long way by booting a microkernel on the PPC and start up a 030-emulator, and then kickstart TOS. Everything will then work as normal, and if you go to the microkernel you can run PPC-native apps in parallel with 68k-apps.

You also have to consider the fact that the 060 is the fastest 68k that will ever be made, so if you ever want an upgrade (which is why most people buy a Milan in the first place I guess) you'll have to use another CPU sooner or later.

> fully supporting OS, or you get what the Mac suffered in the
> transition- 68k emulation by the PPC resulting in less than
> satisfactory performance in the initial models. It took them close to 4

...but now we have the technology and know-how to make really efficient emulators. I don't think this would be a significant problem. After all, a lone Swede (Sven Karlsson) has made a PPC-accelerator for the Falcon, including emulation (although I'm not sure how complete the emulation is).

> And FWIW- the 060 uses a lot less power and puts out a lot less heat
> than the 040s ever did. And perhaps the PPC would be overkill for an
> efficient OS like TOS.

You can never have too much CPU ;-) What's the point of having a lean and efficient OS if your computer suffers from a slow CPU? The point is to have both a efficient OS *and* a fast CPU.

Do you use a kernel from the 1.15-series and a recent minixfs.xfs? Then you'll either have to use a shutdown-program (N.Closure if you're using N.AES) or simply wait for the caches to flush (every five second) before you switch off.

I looked specifications of new Milan. It's well equipped with
peripherals, but I think that forcing 680xx family, with frequencies of 60
MHz is at least pity today. I just read about new AMD's CPU Athlon (former
name K7). There will be version which will run on 1000MHz in couple months.
It is developed with firm Kryotech, and of course will use special cooling
system. See more infos at amd.com or kryotech.com .
Considering that on my K6 at 375 MHz I have 20 times better speed than on
ordinary ST, it can be expected that on 1GHz machine it will be about 80
times ! And of course it will be faster than any Milan, even announced 100
MHz versions. So I see future of Atari in emulation.
I know that some people will not like me because of this, but this is
situation. Mass production of PC components has so much lowered prices, that
no chance to compete to anyone. Even Apple will be in deep trouble soon, I
think.

Pera

Hello Nicholas,

b> - When did Motorola start making an 80MHz 060 ?
Not that fast, but the MC68LC060 and the MC68EC060 are existing in 75 MHz

versions (giving 117 MIPS according to Motorolas website).

Greetings, Oliver

We are Microsoft - Resistance is futile!

It's not hard if you take your time and use a pocket knift as a lever
to hold thetwo parts apart and gently push each of those tabs back. I
did brake two on mine, but fixed the bad area with a plant marker tab
between the metal and the plastic membrain. Works ok now.

Last week I signed onto a game site, www.itsyourturn.com, it works ok with the Atari and CAB, BUT one part!

You are given 40 moves to start with, then there is a header the says:

"Click on here to earn 20 more moves"

I click on there and all I get is the CAB drop down menu and no moves.

I also found out I have to delete my cab's cookies before going there or they'll fill up and bomb cab.

Well, just from looking at Motorola's Web site, on their 680x0 pages,
their wording of things suggests that they are no longer going further
with the series. I believe they are focusing most of their attention
on PPC's. The only new 680x0-related items are the scaled-down
"coldfire" series. But I could be wrong...

but how long can you use a PC ?
6 months ?
1 year ?
after 1 year it's totaly outdated, oldies...
I was a Falcon owner since 3 years, with the Centurbo 1 every "top" software (Calamus, Photoline...)
were working very nice on it.
I bought a AMD K6-2 333Mhz in november 98... it's already outdated, Win98 is very slow (opening a
window is a very very slow process) and not stable (I use also Linux, but I've to update my libraries every months, it's boring !)
and MagiC PC isn't as fast as a Falcon with Centurbo 2...
and it emulates only the 68000, not the 68040 nor 68060...
You can't use the famous Mountain from Remi Vanel on MagiC PC :-(

I think I will sold very soon my PC and buy the Milan 060 or the iMac (MacOS X soon !!!)

> I know that some people will not like me because of this, but this is

Try about 2X faster than the 375 chip. The higher clock speeds in the PC
world do not always equate with a proportionally faster machine. In
terms of real horsepower a 350 mHz Pentium II (K6II) is functionally
about 12X faster than a 32 mHz TT030 - I know, I got both and run
Calamus SL on both machines.
> > times ! And of course it will be faster than any Milan, even announced 100

If the Milan gets the backing of Motorola and Motorola backs Atari
software developers, cleanly written software and operating system can
make up for a lot of processor speed. One of the driving forces behind
todays PC's are games and the fact that MicroSoft and other software vendors
don't write very efficient code.

I wish the Milan people all the luck - if the new model gets off the
ground there will be one on desk :)

1308. MGC99 Update

Newsgroup: comp.sys.atari.st
Date: 1999-06-30 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <ztje3.854$k3.70221@news0.telusplanet.net>
Source record: 76541

Hello all
Here is an update for all who is interested in the MGC99 contest.
Currently we have approx. 7 entries. These daring programmers are making a
wide range of GEM games. Some of the more interesting games being made are:

GEM Pipemania
GEM Kicker
GEM Galaga
GEM Asteroids

And the sponsors are coming along nicely. So far we have over 500$ in
sponsor prizes and we plan on adding alot more! It is almost certain now
that every Entry will get some nice prizes.

So far, our sponsors are:

AtariComputing Magazine who will donate free mags/renegade CD's to all
entries.

M.u.C.S who has donated over 190$ in software

R.O.M Logicware who is giving one lucky contestant a free copy of the
latest Papyrus Office. (app. 150$)

6 Radium CDs (Radium CD's
include tracks from dexter.d and m.pire (produced
with Ataris), raytraced animations, a comic, paintings, starmaps and
more. Each CD is worth about 22$)

So for all Atari users interested in Games.. whether you use a Hades,
Milan, Falcon, ST, MagiCPC whatever, there should be a much wider selection
for you to choose from soon.

(PS for people wanting to enter the contest, you still have plently of
time)

Hi

I think that most web browsers look for 'index.htm' when they go to the
address or change of folder/path. So really doesn't need mentioning,
unless there's a specific page you want to start from. e.g.
index2.htm...

Also lowercase is much better than uppercase (shouting), and easier on
the eyes;)

Because Motorola hasn't done any 68k-development for years now, unless you consider the Coldfire microcontrollers as a 68k. But even Coldfire is departing from the 68k-kernel, and you can never expect a microcontroller to compete with a dedicated CPU when it comes to speed.

> made.." Do you know something I don't? :) Do you think it is

> that Motorola will develop a 68080? If so, please tell me why.

Unless the Amiga or Atari makes a huge comeback there's no chance in hell that Motorola will develop a new CPU in the 68k-series. Who would buy it??

Thinking that Motorola will do anything with the 68k series is just plain stupid. Why would they? There is the new Coldfire family like you said and it's _MUCH_ cheaper, faster and the intro model is to some degree even 68k compatible. The 68k is only used in the embedded (any even there it's _very_ rare that anything above the 68040 is used) market these days and it's slowly shifting out from there as well.

So don't fool your self in thinking that there will be a new 68k processor.

Also, how much trust can we put in this new rumour? From what I have heard Ali talks lots of shit and there are many who knows him which doesn't believe him. If it's true, I would think it would be very cool indeed, but don't hold your breath. I wont.

I get a similar message when I run fsck, something about drive P being
invalidated & bits not written. I don't believe it's an issue.

For switching off, you could kill all user tasks, wait a few seconds for the ,
cache to be written, then switch off.

Does anybody know if there is a version of sync that works.

I like to park the drives before switchoff, just to be sure.

I migrated, unwillingly at first, several years ago from my three trusty Atari STs to a Mac
which now sits below my desk at home with Cubase VST running on it, quite happily the reliable centre of my home recording studio. At the moment it's a
132MHz 8500 which gives me 10 audio tracks alongside the midi. It's crashed
maybe 10 times in the two and a half years that I've owned it, which is way better
than any Atari I ever had (and I've been through about thirteen in my time)

>
> Now all they need to do is get some Professional Audio software for the
> new Milan and my studio will be controlled by Atari once again !!!
>

Can you really see the Milan, at 60MHz, keeping up with the 466MHz Yosemite
G3 that's on its way to me? I loved my old Ataris, but I can't see that the Milan
has any specs that would make me want to have one alongside my Mac, let alone replace it. There needs to be a clear path for the Milan to take with regards
to the future of the CPU, and the 680x0 series is obviously not going anywhere
if the latest version Motorola is shipping is clocking at around 75MHz.

It's such a pity that the Milan seems to me to be so half-baked. An operating system
as good as TOS shouldn't go in the bin because the hardware developers have no
foresight, but it will if no-one is realistic about the future of the market. The
PPC series of chips has its low-cost, low-consumption end, so why didn't they
take that path? If TOS 4.5 has been so extensively rewritten, the programming
team should have started again with a processor that is worth it. TOS is right up there

with the MacOS for ease-of-use and functionality, so don't abandon it. Then the Milan
could have been a series, with a 1GHz G4 version for the most insane and over-wealthy
buyers. :-) My advice to the Milan team is to think long and hard about where
you and the fiercely loyal Atari user-base are going and get a little more real with
the R&D. Then you'll have machines that kick the crap out of Windoze boxes

(admittedly not very difficult) and frighten the Mac community.

If this sounds like an anti-Atari rant, you obviously haven't been paying attention.
I use a Mac, I still love everything Atari, and would rather disembowel my mother than
have anything to do with Windows.

-keep the faith, Mark

Mygale (not MyGal !!! a mygale is a deadly spider!!) has actually moved.
You can reach most old mygale pages by doing the following conversion:
old: http://www.mygale.org/~login or http://www.mygale.org/01/login
new: http://www.multimania.com/login

Therefore, Laurent's new URL is http://www.multimania.com/ldesoras/

Ta muchly, If I had a penny, old or new, for the typos I see on
messages, I'd be as rich as Rockafella (or is it Bill Gates)!!!
I always sign my name with a space between the Bob and the King, but
some-where in the bloody system that's been taken away as well!!
But seriously, Nicholas, thanks. Actually I had already been to the site
you quote (didn't known it was the 'Son of Mygale') and the 'Graoumf
Tracker' page part is dated 1998/12/29 and he mentions there that 'a PC
version is in preparation'. Now he seems to be pushing it. So what I
wanted to know was -- has he dropped the Falcon version. In retrospect
the best person to ask is Laurent himself, so must e-mail him.

Thought!!! I wonder if this 'deadly spider' you go on about is
responsible for the typos?

Bob (with a space) King

Uhm. I have a 333MHz K6-2 and it's not far behind my Falcon/AB040 under
emulation (PaCifiST).

For most 'real' work, the processor should be 10-20 times faster
(than a 32Mhz '040 that is) or so, but I don't currently have many
programs to do a valid comparison with.

In case anyone really wants to know, I could port some sources. ;-)

>> > MHz is at least pity today. I just read about new AMD's CPU Athlon (former

>Try about 2X faster than the 375 chip. The higher clock speeds in the PC

There is a _very_ large difference between the internal architectures
of the Athlon and the old K6-2.

>world do not always equate with a proportionally faster machine. In

Clock speeds almost never do that, but in this case the Athlon does a
whole lot more per clock cycle, so it's very difficult to say.
Just looking at the memory, for example, the K6-2 has a second level
cache of perhaps 512kbyte on the motherboard, which it can access via
a 100MHz bus. The Athlon has its cache (also 512kbyte on the first
processors, it seems) on a special bus, running at 1/3 to 1/1 of the
processor core speed (half of 500-600MHz initially).

>terms of real horsepower a 350 mHz Pentium II (K6II) is functionally
>about 12X faster than a 32 mHz TT030 - I know, I got both and run
>Calamus SL on both machines.

That only says that its 12x faster running CalamusSL, of course.

>If the Milan gets the backing of Motorola and Motorola backs Atari

I really don't see why Motorola should get involved in something like
this, but it might of course make the potential market somewhat larger.

>software developers, cleanly written software and operating system can
>make up for a lot of processor speed. One of the driving forces behind

With an OS as limited as TOS, it doesn't really matter much how
efficiently it's implemented. It doesn't do much of anything that
affects the speed of most applications, anyway (except for graphics ouput).
It's another matter with an 'everything but the kitchen sink' OS, like
Windows.

In the Phenix a second CPU is foreseen. Maybe Milan too will become a
multiprocessor type of computer? Will we see quadruple 68060's in the future
Milan computers? In that case we'll be seeing very much altered operating
systems as well.

> You can never have too much CPU ;-) What's the point of having a lean and

A lean OS is as fun as a skinny girl...
It's better to have the excess fat and a couple of hefty CPU's to move it
all. Seems like unix based derivates will do the job best. Maybe with a GEM
window manager.

The leanness you talk about is with Windows in mind I suppose?

Try opening the file you want to print into a new window by holding the
shift key down when you select it. The other way is to use the CACHE editor
to find the file you want to print, and save it out and load into CAB
later. I've used these methods myself, so I do know they work, though
not as good as just printing direct!

Kind regards

It looks that you didn't tried some really power hungry application on
your PC. And I even didn't mentioned FPU built in Pentium class CPU-s.
There is speed difference bigger for factor of about 10 (additional).

> If the Milan gets the backing of Motorola and Motorola backs Atari

>

There is too much 'if' . If hardware manufacturers will... then software
will... etc. Milan is not new machine, and new version not brings
significant speed increase, only peripherals are better.
I think that it's almost impossible writing very efficient code by such
complex OS-s like Windows, OS-2 , Linux and similar. Yes, games are driving
force, and it's normal. People like play as possible so realistic games, and
there is enormous space for development. Also it's very big money in game
business. Who will make games for Milan, when today you need team of 20
people to work year -two to make really good game. As I read some titles
were sold in count over 5 million.
I think that main problem is that Motorola stopped development of 860xx
family. We have Power PC for long time already. Even new Amiga should use
it.

> I wish the Milan people all the luck - if the new model gets off the
> ground there will be one on desk :)

Luck will not help much today. People want fast machine for low price.
Remember Atari's slogan: 'Power without price' . Last machine which
deserved such qualification was STE. Falcon was never enough cheap to
compete.

That's not true. I know many people which still uses 386 machines for book keeping and similar purposes.
You may buy complete system with mono monitor and hard disk of about 100 MB for 200 DEM. Just add printer, and you can work fine with old software.

> I was a Falcon owner since 3 years, with the Centurbo 1 every "top" software (Calamus, Photoline...)

> window is a very very slow process) and not stable (I use also Linux, but I've to update my
> libraries every months, it's boring !)

If your Win98 is slow with K6, there is something wrong with video card or other thing (hard disk ?). I didn't found Win95/98 instable. Yes, there is many idiotic solution, but also we have lot of free and quality software.
I installed OS-2 and Linux, and I had lot of troubles with both. OS-2 works so much with hard disk, that it's make man to start worry for health of it.
Also Linux has problems with work with many cards.

Btw. I still use my old ST for some work. I made IDE disk interface, and some other peripherals, and I can work really fine with it , using old software.
Other btw. : It looks that almost nobody makes new software for Atari machines. So we can't even talk about reliability. Mint uses only small circle of people, as I see mostly developers of it.

> and MagiC PC isn't as fast as a Falcon with Centurbo 2...

I know that in Germany very few iMac was sold. In USA Apple has much bigger base and tradition, especially in education sphere, where he sell with big assent.

> emulating Win98 with Virtual PC with a PC 333mhz running Win98... YOU WILL CRY !
>
Hmmm, your beloved Milan uses some innovations from PC world - like PCI slots, IDE disk ports . Why not uses some Macintosh compatible slots/ports ? Drivers are least problem today, Internet is full with downloads. Only trouble is if you buy some no-name card, then don't expect any support, and newer drivers.
Who will write drivers for Milan for diverse cards ? Even Apple has very few supported cards.

CPU's used in PC's are best in compare of price/speed. There is no doubt. And all newer are with RISC core. K6 and Pentium II can execute up to 4 simple instructions in one tact.
680xx family is really fine for programming in Assembler, and I enjoyed it, unlike 86x-s assemblers. But it's not enough.
Finally, PC world will in couple years go through big transformation, like Macintosh when Power PC arrived. New Merced CPU will not work with 68x code. Who will cry then, we will see.... My first candidate is Microsoft :-) .

I would like to hear from any CyRel, Sunrise M16-1280 graphics card user who has successfully Magic.

I need some help with MagiC 6.

I have NVDI 5.02 installed with SpeedoGDOS 5.7 though I find that the file Show/Print output is affected badly with NVDI.

I would like to know what options you used under MagiC's installation?

I would like a step by step process how to edit the MAGX.INF and or the REDIRECT.INF to ensure use of the current 1024x768x256 screen resolution I use on my CyRel.

Mike,

Tried to get WDIALOG.PRG to run in the Auto folder but it crashes my system. I did not try changing location. I am under the impression that this program is only needed if running MAGiC.

The program that does not recongnize GDOS is GEMVELOP.PRG.

It's not outdated if you don't buy any new software...

>I bought a AMD K6-2 333Mhz in november 98... it's already outdated, Win98
>is very slow (opening a window is a very very slow process) and not stable

I have the same and mine's not the least bit slow at anything except the
very latest games. Windows open in the blink of an eye.

If you're talking about opening directory windows, that has very little
to do with the processor, as you can notice by listening to your harddrive.

>You can't use the famous Mountain from Remi Vanel on MagiC PC :-(

What's that?

>I think I will sold very soon my PC and buy the Milan 060 or the iMac (MacOS X soon !!!)

What's so very innovative about the iMac?

>drivers, a very huge system (200mo mini) and worse of all the CPU ! a old
> CISC ! compare an iMac 333

The P6 (PPro, PentiumII/III) and AMD K6/K7(Athlon) are actually RISCs
deep inside. They translate the x86 instructions on the fly.

The CISC/RISC thing is of course irrelevant to most users, but if you
compare Spec95 benchmarks you'll find that the PPC750/400 delivers
18.8 SPECint95 and 12.2 SPECfp95 (according to Motorola themselves at
http://motorola.com/SPS/PowerPC/products/semiconductor/cpu/750.html, but
the numbers are apparently estimates for some reason), while the
PentiumIII/550 does 22.3/15.1 (according to Intel) and the AMD Athlon/550
109%/146% better than that chip (according to AMD).
Not bad for the 'old CISCs'!

The very best chips today (according to www.spec.org) seem to be from
Digital/Compaq and HP and they reach about 30/50. That is, not all that

much better at integer, but more than twice as fast at floating point work.

n> with the series. I believe they are focusing most of their attention
n> on PPC's. The only new 680x0-related items are the scaled-down
n> "coldfire" series.
Absolutly!

But on the other hand Motorola says, that the CPUs of the 68k series are
still the most successful ones for embedded systems (sounded, as they
couldn't believe it by themselves ;-)).

So why not?

Anyway: PPC would be faster, 68k seems to be cheaper.

Well, the lean Atari OS perhaps is nice to broach about, but what good is
it today? At least one thing one can say about Win-95/98 is it's pretty
complete...

Now I don't run TOS much, my OS still is MagiC, but what comes on top of
that? First a decent desktop with facilities, Thing here. How much takes
Thing? Next a decent fileselector. Next a bunch of CPX'es. A few accs,
like ST-Guide, whatever. Next comes a texteditor. A viewer just to view
stuff. Installed apps for system handling. My NVDI plus bunch of fonts to
work with something else than only bitmapfonts. The card driving s/w, the
TCP/IP stack, goodies like Calendar, Multistrip, Bubble help, not to
mention a bunch of drivers for all kinds of s/w just to get a printer
going. Don't talk of gfx cards, ethernet cards, whatever.
I'm probably forgetting lotsa other stuff. Count it all up, does it fit on
a 20 meg hd??? I backed up my *basic* system the other day, including the
Internet bunch and it did fit on one 44 meg cartridge...

OK, a basic/"lean" Win takes around 50 megs too but then the difference
ain't that big...

OTOH, the Microslop bunch isn't programmed efficiently, neither does it
"use" space efficiently. I created an RTF file in Papyrus, using several
tt fonts, making sure the Winbox had them too. Filesize 3800 bytes. I
loaded the thing into Word, and saved again as RTF in Word. Size became
225% of 3800 bytes....

Finally, who was talking about Win being stable??? I said recently, don't
do anything, don't use anything, well maybe it keeps going.
Not even m/t-ing, the blue screens are numerous. Problem is, you can't do
much from there. 99 out of 100 times you need a restart. Even if you're so
lucky to get the box with one or more apps "not responding", the "finish
task" or "close app" options won't work at all.
I had one of those machines today, after removing the network card from

the active profile I restarted, and it refused to get even to Win. With
the bootkeys disabled you can only get to Win's safe mode using a boot
floppy...
After I got back into Win it somehow had managed to activate 3 floppy
controllers (for just one A-drive) and 3 gfx card devices for one
plug/play monitor.... (hey Bill, please explain!)

> Does anybody know if there is a version of sync that works.

shutdown command (to be found on ftp://ftp.atari.org.pl/pub/atari/mint
or alternatively ftp://piwo.bl.pg.gda.pl/pub/atari/mint) calls sync()
before closing the system and generally does all stuff that seems
necessary. i am not sure if n.closure does it too.

> I like to park the drives before switchoff, just to be sure.

If you have an IDE drive, you need not to park it. Even older drives
(like Maxtor 7345AT) are able to flush their internal write cache and
park the heads when the power goes down. However, this does not apply to
the write cache maintained by the filesystem driver; this one has to be
flushed "manually" (using sync() call).

I don't think SCSI drives need to be parked either, though I am not
an SCSI specialist. :)

>

Hi Bob,

I heard some time ago that the Atari version of this programme was being abandoned in favour of the PC platform - obviously aiming at a bigger market ;-)

If you are looking for trackers, here are some to check out;

DBE Tracker from STGhost/Sector One
This is capable of handling many of the current multichannel mods available from the PC - with the exception of Impulse and Mad Tracker tunes.
Denis is still updating the routines for this (in between his work on an Atari MP3 player).

Flex Tracker.
A new project from Thomas Bergstrom. It was originally created as a tool for demo-makers but has proved so popular with musicians (because of the extra features) that Thomas is already updating it and sees it as an ongoing project.
This one only handles .MOD format (up to 8 channels).

mik Tracker.
This has now been ported to Atari and is being tested (under MINT at this time. I heard yesterday that it will (hopefully) even run under TOS !

Hope this helps.

Jim

>
>--
Yes indeed I have a very new kernel, taken from the belgium FTP-site
3 days ago.
After some fooling around with a .gz file and gzip.ttp I extracted a
working kernel. I needed that one because I am trying out to get
Linux working on the TT.
I wanted to have the Lunix ext2 partition visible with MintNet and
exportable. That works now.
About the minixfs: I use the one that come with the Nint 98 CD
install. date 2/8/98.

I see the light of the drive come on every few seconds.

I use n.closure but next boot always gives: 'zone bits not written
out when drive F invalidated'.
And repairing is done with the star-sprangeld message 'file system
changed.'

>Calamus SL on both machines.

Thank for this bit of information. I was thinking: am I mad or wrong?
But for the first time I find someone mentioning the same application
running PC and TT.
I found out that the PovRay raytracer version 3 goes about 20 times
faster on a PC with Celeron 400 MHz.
And I do not think that is a question only of 'better code generated
for Intel then for Motorola'.
It is the intensive floatingpoint that does it in this case and the
fact that a big part of the looping program code and data can be in
fast 128 kb cache.
The 680xx series takes many clockcycles to do the floating point,
more then the Intel I believe.
Correct me if I am wrong.

Frank,
I neglected to state I'm running NVDI 5.01 with the WDIALOG that came
with it on a Falcon (if any of that means anything?). Also, there are a few
versions of WDIALOG out there. An older version used to get corrupted
(at times) when running CAB and crashed the system while on-line and had
to reboot to load CAB again! However, I'm not experiencing those type of
crashes with NVDI 5.01, etc.

It's actually the web server which looks for index.html or index.htm if it's passed a directory name.

>Also lowercase is much better than uppercase (shouting), and easier on
>the eyes;)

Actually, it's simpler than that - URLs are case sensitive, pure and simple. Comes of originating in a Unix environment. So HTTP://WWW.WHALLEY.DEMON.CO.UK doesn't exist, http://www.whalley.demon.co.uk does. On the rare occasion that entering the wrong case or mix of cases works, one has been set up as an alias for the other, I think.

It would be a help if some designers got to grips with this: you see loads of adverts in magazines with upper case URLs. I suspect they mostly get away with it as people don't switch to caps when they type them in.

You'll have to get WDialog to run to use the CPX. Move it or try a
different version. It run here when I boot in Geneva so I know it can be
done.

You have it wrong; you need it except *with* the latest version(s) of
MagiC.

>The program that does not recongnize GDOS is GEMVELOP.PRG.

GEMvelope definitely works with NVDI v5, I use it here, but it doesn't
print until you quit. Strange, but usable. I sent Email to Jeffrey when I
first upgraded to v5 but I never hear anything back.

If you're using N.AES or any other AES ontop of MiNT, do _not_ run
WDIALOG from the Auto-Folder, but from the config file of the AES, e.g.
gem.cnf or n_aes.cnf

Ciao

I know, but I can't imagine that there are many new designs using it.

> So why not?
>
> Anyway: PPC would be faster, 68k seems to be cheaper.

It's not, cheaper that is. You can get a 300MHz 603 cheaper than a 68030.

A 50MHz 030 as used in the CT2 costs $100
A 33MHz 040 as used in the Milan costs $212
A 50MHz 060 as used in the Hades costs $425
A 300MHz 603 costs $88

So the 68k is a realy bad idea to use!

I don't know what you are shooting at but who in earth would like to
use a 2U VME card in the Falcon which costs more than a DEC Alpha???

Also as you have probably seen, about every company who sell 68k VME
cards also sell cheaper PPC/Pentium VME cards. There is no doubt
that there are many many 68k embedded systems out there, but they have
all been around for a couple of years now.

Hi Mike,

Mike wrote;
If one does a search out for "060", you will find many
060 embeded cards that are available with a standard VME
interface. There are a few dual processor
80Mhz cards with ram, ethernet, scsi and serial
connections. It sure would have seemed a lot easier to adapt
a VME to the Falcon bus than to and develope a
PPC card for the same price without the scsi or
networking..... But then some like to do things the
hardway. Backward compatibility is king, so long live the
68K and Atari.

MK wrote:
I don't know what you are shooting at but who in earth would
like to use a 2U VME card in the Falcon which costs more
than a DEC Alpha???

Also as you have probably seen, about every company who sell
68k VME cards also sell cheaper PPC/Pentium VME cards. There
is no doubt that there are many
many 68k embedded systems out there, but they have all been
around for a couple of years now.

//MK

Well, I don't know about a DEC Alpha for a standard 060 VME
card for compairson. I will admit that some are really
expensive. But just for fun, I really don't think that
spending over $1100.00 for a tempest and eclipse without
fast SCSI or networking is a very smart move either. Most of
the VME cards run POS-X and have a ton of flash rom onboard.
At least you can work with a card like this into the future.
With the eclipes (or whatever)PPC card, your likely to
become stuck at one point just like Afterburner users are
(without major hardware changes)now. PPC for the Atari may
be a nice vision for the future, but I don't think this card
is the answer, not only hardware withstanding, but software
compatibility. Maybe two or three coders will bother with
PPC code. Without that all you will have is a fast TT. Maybe
for all the Linx and MiNT freeks, this will be THE card, but
for the average Sam, if it's not 100% with his existing
software, why bother? So he can compile two minutes faster?
Anyway, there are pro's and con's to this project. In the
end, it made no difference for the typical Amiga user. I

doubt that it will be the second coming of Christ as Titan would like it to be. You doubt the word of the Milan people, I doubt the reliability of a U.K. company to deliver support and goods to the U.S. in a timely and cost effective maner.

Why does Titan (Core) still advertise the Expose with price on their new web pages. I guess for history, it's nice to have this posted. But it misleads people to think that they are still actually available. Surely if they were, Core would be servicing those units already sold with working replacements wouldn't they, or at lest suppling a repair schematic and replacment parts for those users with problems.

Mike

Hello

I'm looking for a DMA cable (19 pin male to 19 pin male) to connect a Harddrive to the ST.

If you have one or could give any clues as where I can find one, that would be great.

Thanks!

Hello Magnus,

mk> I know, but I can't imagine that there are many new designs using it.
I really don't know, but reading the website of Motorola it just sounds
that
way.

mk> It's not, cheaper that is. You can get a 300MHz 603 cheaper than a
68030.
A stand alone 68k is just as useless as a stand alone PPC, you have to
built
a system around it. An embedded 68k system is cheaper.

S> that these were case sensitive and the FTP program I was using was
S> making ALL the files names and folder uppercase!
S>
S> Strangely the files in the root directory all remained lowercase!
Sure?

Typically a FTP program offers to convert all filenames to lowercase (at least, I don't know any program, which converts to uppercase, because uppercase filenames are not usual at the internet, but the lowercase conversion is at least needed for FAT filesystems like DOS & Windows or TOS).

I suppose, that your desktop shows the normal 8+3 files lowercase, but in

reality they are all uppercase. 8+3 FAT filenames are always uppercase, but
some desktops (some for TOS or the Windows Explorer) change the names in the
display (and only for that purpose).

Greetings, Oliver

I don't think so. ATI Rage AGP video, Seagate Ultra DMA HD. I've heard
this hardware is fast with a lean OS like Linux, so I'm reading up on
that now. But Windoze really puts me to sleep with long boot up times
and lengthy hard drive accesses. It's always a pleasure to boot up the
Falcon or STE and get a quick boot up, and software that quickly loads
into memory and stays there.

I bought me HD-driver 7.71 quite some time ago and found that on my Hades
I couldn't access my SCSI-devices anymore as soon as HD-driver 7.71 was
installed. If I try I notice that my bootdrive (an IDE) spins and that my
mouse pointer becomes a busy bee but that's it, the SCSI device that I
wanted to open remains closed. The only thing I can do at this moment is a
reboot.
At boottime however HD driver recognise all my SCSI-devices but I just
can't open them. If I run "auto configuration" I ran also into trouble.
The same symptoms as above.

According to Uwe Seimet HDdriver won't work on the Hades because the
SCSI-routines of the Hades are not compatible enough with the
SCSI-routines of the TT.
Fredi Ashwanden (Medusa systems) however says that it's not the fault of
the Hades but the fault of HD driver.

BTW: HD driver 7.61 works just fine.

Normally not, but 7.7x can remap other partitions to A:, so there might be
a problem there. If I tried to access the floppy with 7.71 installed I got
"Data on drive A: might be damaged"-messages every time. I *did* check
that I didn't have any partitions assigned to A:.

> About the Zip drive, I'm assuming you have the drive ID
> selected in HDDriver, right? Other than that...

Yes, HD-Driver recognised the Zip, but regardless of the configuration it
would only read the first 16Kb of it... If I repartitioned (or even
reformatted) a disk it would only have 16Mb available, although I
partitioned it with one single 96Mb partition. Thing could not eject the
disk either.

I fiddled around with 7.71 for a few hours before I gave up and returned
to 7.12, the latest version that works on my Falcon/AB.

Sounds painful...

In the context where it was used it was a way overdriven statement. Even for figuratively speaking. This reminds me of the oppositely often too restrained expressions in Swedish. A woman dressed in a morning gown standing in front of her burnt down house is asked by a journalist how she feels:

-One gets a little sad...

No tears, no curses, no big gestures. Like king Lear when he got news of his son's death. Tired from all misfortunes he only managed to reply:

-So it goes.

Or the swedish general on the war in Bosnia, when it was at it's worst:

-As we all know there's a little trouble down there...

So the phrase "I'd rather disembowel my own mother than hm-hm..." is in the line with expressions like "Over my dead body"? Not meant to be taken litterally, but like an overemphasized statement of defiance?

Interesting how a machine can bring up such strong emotions.

A Falcon is cheaper and runs better with Papyrus :-P

> If your Win98 is slow with K6, there is something wrong with video card or
> other thing (hard disk ?). I didn't found Win95/98 instable.

hum... my configuration is:
AMD K6-2 333Mhz
Millenium 2 AGP 8mb
ASUS teck P5A 100Mhz main board
Ultra-Wide SCSI Adaptec PCI card (2940-UW)
IBM 4.3Gb UW-SCSI
64mb SD-RAM 100Mhz
only EXCELLENT and reckonized hardware !
Linux is very very fast ! (Gimp explodes Photoshop)
but Win98 is a pure turtle, very slow, very instable (don't lie, Win98 isn't a stable system !)

> Also Linux has problems with work with many cards.

I think you have an exotic card... XFree now supports a lot of cards...

> I know that in Germany very few iMac was sold. In USA Apple has much
> bigger base and tradition, especially in education sphere, where he sell

Either ways, the Falcon has no VME bus. TT does, though. Oh yeah.

I've started investigating what cards could work on a TT, to add
a section to The TT030 Homepage, because I keep on hearing that
NASA and many other US government agencies have used TTs because
they were the first affordable 32-bit workstations and have VME.

> Also as you have probably seen, about every company who sell 68k VME

Economy of scale, of course.

> There is no doubt that there are many many 68k embedded systems
> out there, but they have all been around for a couple of years now.

Make that, almost 10 years in some cases.

Basically, 68k technology is old as hell; some might say deprecated.
Then again, in real life, it's not a specs war. It's, what machine
gets the job done the quickest and in the most efficient way.

Atari wins hands-down, because programming an app to work within
4 MB of ram, limited hard-disk and diminitive graphic capabilities
means that coders create really compact, fast and efficient stuff.
By the time you run the same app on a TOS clone or 68k MagicMac,
things fly at speeds windows 1901 can only dream of, even on a K7.

Why not? Intel chips are always quoted at an overclocked speed (hence the prodigious use of heatsinking/fans). There are varying degrees of this, and with current 68060 running at a stated 75MHz, 80MHz overclocking will not cause problems. An 80MHz 68060 on a 32-bit 40MHz bus with 40MHz SDRAM access would be rather nice indeed...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Just a quick follow up to this:
We learned today that Woller kindly is providing us with *3* copies of the highly anticipated N.AES Version 2.0.
This means that the first place, second place, AND third place winners will all also recieve N.AES 2.0.

Thanks,

Hi,
I'm looking to buy an IDE i/f for an STE and recall seeing that some
Aussie geezer does a good one which has a distributor in the UK.
Unfortunately that's all I know, anyone have an address. Also, I'm on the
lookout for a distributor of an Atari to SCART cable. All info appreciated.

If you were to slash someone's lower abdomen open with say, a rusty meat hook, and reached inside their body cavity and pulled their intestines out, it would be safe to say you had 'Disembowelled' them ;-)

Maybe it was the unidrive.dos file that I swapped. I don't remember
for sure now, and I have lost the mails when I was beta testing.
Try the unidrive.dos from V2.4 with Gold version.

If one does a search out for "060", you will find many 060 embeded
cards that are available with a standard VME interface. There are a
few dual processor 80Mhz cards with ram, ethernet, scsi and serial
connections. It sure would have seemed a lot easier to adapt a VME to
the Falcon bus than to <try> and develope a PPC card for the same
price without the scsi or networking........ But then some like to do
things the hardway. Backward compatibility is king, so long live the
68K and Atari.

I just ran wdialog from the desktop and was then able to utilize the
printer cpx without problem. The version is V2.04 and NVDI is V 5.01.
I had it disabled for some reason in the autofolder on this machine.
It's located about the middle of my autofolder (not that this makes
much sence:).

SCSI is all I have, no IDE.
I guess you don't really have to park them, but if the heads are in the park
position, there's less chance of something going wrong.

I think some SCSI drives can auto park on powerdown.

n> of adverts in magazines with upper case URLs. I suspect they mostly get
n> away with it as people don't switch to caps when they type them in.
No, it is (if not a fault) just for attention.

I.e. www.IBM.com or News@Whalley.Demon.Co.UK could be much more common for

peoples eyes than all written in lower case (therefore easier to remember

because it is matching the real company name better).

I uploaded some data on my web site, and I couldn't work out why it
didn't function properly. It worked fine on the PC with IE4, even better
with CAB on the Atari.

Graphics were missing and links bad etc.. At the time I didn't realise
that these were case sensitive and the FTP program I was using was
making ALL the files names and folder uppercase!

Strangely the files in the root directory all remained lowercase!

This is an old version, it's a lot slower than new ones and doesn't use the kernel's caching-mechanism. I strongly suggest that you get the latest version (also on the Belgium n.n.n.n ftp-site), it really is a lot better.

> I see the light of the drive come on every few seconds.

Yes, the old minixfs.xfs has its own writeback-cache which is flushed rather often.

> I use n.closure but next boot always gives: 'zone bits not written
> out when drive F invalidated'.

Sounds like I problem I had about a year ago. I can't remember in detail what the problem was, but fsck couldn't fix it. I solved the problem by backing up the minix-partition (with tar) to another partition, reinitialized the minix-partition and installed the backup.

Btw. this happened just when I upgraded HD-Driver, my C- and D-partition got damaged beyond repair as well so I suspect that HD-Driver did some irrecoverable damage. I "downgraded" to 7.12 and hasn't had any problems since.

Btw. I tried to upgrade HD-Driver to 7.71 a while ago, but after I did that both my floppy and Zip-drive (SCSI) stopped working. I tried various configurations but the problems persisted. Does anybody know what I have to do to get 7.71 to work on my Falcon?

If any one is thinking of using this fascinating information, please do
not use a 'rusty meat hook' - it's so unhygienic and could give the
disembowelled a nasty disease. Oh yes and be sure to ask the recipient
of your attentions for his/her/its permission before you start, it's
only polite.

> How does one upgrade the TT030's RAM when Atari only sent it out with a
> 4/4 configuration? Advice and stratagies, please.

If you have the newer CA401059 ST-RAM card, it can be upgraded to
8 MB if you have proper hot-air desoldering tools and skills, for
a total of 10 MB of ST-RAM (2 MB on motherboard, 8 on card).

The TT-RAM card is also upgradable, but if you have the older
CA 400312 card, it requires trace-cutting and more work than
people would bargain for. The CA 401058 card already accepts
4 MB simms, you just have to change some jumpers.

Everything is documented in the Memory section of my homepage.

Are they great? How can I tell, if there's no info and no reviews
quoted on the site? I have asked him before, about his Veloce+, if
he could get around uploading something. He never did. Idiot.

A couple months ago Hotmail started using cookies... and if you had
cookies turned off, you couldn't get in. I'm not familiar with CAB, but
perhaps it doesn't support cookies?

For those who don't know what cookies are, I found this on the internet:
"Cookies are a general mechanism which server side connections (such as
CGI scripts) can use to both store and retrieve
information on the client side of the connection. The addition of a
simple, persistent, client-side state significantly extends the
capabilities of Web-based client/server applications."

Hope this helps,
Andy Blakely

This was a bug in FreeMiNT itself in interaction with the filesystem
checker.

Hope you didn't delete really all? Those PS/2:s can be tricky to revive
without that setup disk which is required every time you change something.
DRDOS is crap. And it paints you into a corner. Rather use the latest
possible MS-DOS and install Arachne, the DOS based Internet browser.
You can download it from:

http://home/arachne.cz/

Don't think that this is some ugly ANSI kid! It has pretty graphics and a
GUI.

People are more kinky than one believes, specially upper class Englishmen...
Ministers with plastic bags over their head, orgies with dwarfs, PS/2:s in
hospitals. Nothing surprises me any more...

:^)

> I also have an Amiga...as well as my Atari 800XL, 1040STe, Mega ST,
> TT030, and Nemesized Falcon running MiNT. (Lynx and Jag too!)

Obviously you're a computer megalomaniac. Why not pool all that energy into
something altruistic? Mr Spock once instructed the ship's computer to
calculate the exact value of PI (Ludolfs number). Stupid as it was it went
for it and assigned more and more resources for the job, which of course is
a never ending task. This in turn led to reduced attention to other tasks
which made it possible for Spock to get in and turn the damn machine off.

However, what impressed me the most was the speech interface which recognized Mr Spocks (and everyone else's) voice commands. A crew member only needed to speak out into the air, "Computer, calculate the distance to the Andromeda galaxy and estimate the time needed for a warp 9 journey to it's closest arm". And the Ship Computer did it.

Now THERE's a Good User Interface!

Only problem is that it would require a computer system of it's own to get realized. Well, you have a Falcon, don't you? Microphone in and audio out. Nudge-nudge, get my drift?

Hi, everyone.

I have just unsuccessfully tried to find some earlier messages in Atari newsgroups on Dejanews. I have tried it both via Hallvard's Launchpad and directly, and in both cases I get the message in CAB that the Dejanews "server does not respond".

Does anybody have problem contacting Dejanews news database? Has the URL changed? Maybe I have missed some info on that item, as I was out of touch with newsgroups and Internet in general for a couple of months. Can somebody help, please?

Thanx in advance.

Cu.

But beware: if you happen to get a cable with unsuitable characteristic impedance, it may work unreliably. That has happened to me. The symptoms are: disk driver reports occasional errors in communication with the HD.

They say that grounding the cable shield at both ends can also cause problems here.

And it may not be easy to find the D-19 connectors.

Cu.

Hi,

well, today I finally got my replacement for the differential SCSI IBM-0662 drive, a Seagate ST 12400N drive. 2 Gigs, hooked it up, partitioned it and finally I have some space to breathe in... :-)

Next Q of course is: who knows about the jumpers on the front side. Those on the side I suppose to be the ID ones. But the row on the front...

None of them is jumpered, the drive works fine, can autoboot but nevertheless I'd like some info.

And tomorrow I'll get this Mega-STe, and with it a (hopefully) nice working keyboard so I can replace the TT one that won't let me use the "l" key properly, and has a degrading spacebar, m-key and the "ENTER" thing stopped working some months ago...(Am I glad there's a separate "RETURN" key...)

Next job is repairing the mylar on the TT-kbd... I'm not looking forward to that one! :-)

Hi Al,
Ofcourse that is very sad to hear, but I wish you would have opened it up even further: Instead of allowing any usergroup to take it off your hands, I would have expanded that (*if* you could see no user group wanted it..) to any individual who was interested. I would have /loved/ more then anything to get my hands on that stuff, but I am no member of an Atari usergroup nor Do I have extra funds to go towards that. I really can't even think about 700 titles being destroyed, Aurgh it just makes me so angry. As i said, I would have loved this stuff...As im sure lots of Atari individuals would have.

Well thanks for all your support over the years and good luck in the future.

Because those are GOOD things. No reason for the rest of the world
to stay behind with us. SSL protects you from people accessing
important information such as your credit card numbers, passwords,
etc. Sure wish I could do my banking online, but I sure don't expect
nor want my bank to have my account info up there unprotected.

And CAB 2.7 supports cookies, though none of the CAB.OVLs work 100%
with them. I've found the CAB.OVL that comes with CAB 2.7 probably
works the best. Dan Ackerman's works pretty good, too. Olivier
Booklage's doesn't seem to work at all, at least for me.

Source record: 76474

June 1st came and went and The Computer Dungeon closed its doors for the last time.

It was a great time running the Dungeon; the best experience of my life. But eventually reality set in and there wasn't enough sales or interest to keep the business afloat. I can't begin to relate the feelings I experienced when I decided to close the business and began the process of doing so.

But the saddest part of all was watching over 700 ST & Falcon software titles loaded into the back of the county refuse truck and hearing the sound of the crusher doing its job.

We tried to find the software a good home: we ran a "Garage Sale" during the last two months we were open where people could name their own buying price but only 9 offers were made & 33 titles sold in over 60 days. We said we would give it away FREE to any user group that wanted it and all they had to do was send us a letter on club stationary asking for the software and offering to pay for the shipping charges. But not one letter came.

Over 700 ST & Falcon software titles: from Calamus to Pagestream; from Dungeon Master to Populous; from Bentley Bear to Steinberg. Plus joysticks, mice, cables, two ST's, 8bit software & hardware.... gone.

It was great running the Dungeon.... and sad to see it close.

Thanks to all who supported us.

Al Horton

->reformatted) a disk it would only have 16Mb available, although I
->partitioned it with one single 96Mb partition. Thing could not eject the
->disk either.

That seems odd. With v7.61, I've used both an EZ135 and EZ230. Both
worked just fine (after I turned them on in HDDriver <grin>) and Thing
does find and eject them.

You know, I couldn't figure out at first why HDDriver wasn't finding
them when I booted up (via HDDRIVER.SYS) so I did something that I'm
not sure is well, "correct". When I first booted HDDriver from floppy
(first time installation), HDDRIVER.PRG in the AUTO folder found my
IDE and SCSI stuff. So I renamed HDDRIVER.SYS to HDDRIVER.BAK on my C:
drive, then copied HDRIVER.PRG from the floppy's AUTO folder to my C:
driver and renamed it to HDDRIVER.SYS. I re-booted, and it found all
my drives, SCSI's included. Then, I configured it withe the utils,
and only made once change at a time, so as not to loose my SCSI drives
again. Well, it worked... ;-)

(I'm sure all that I needed to do was read the docs more carefully
but you know how us TOS users are... <grin>...)

->I fiddled around with 7.71 for a few hours before I gave up and returned
->to 7.12, the latest version that works on my Falcon/AB.

So you tried v7.61 as well? Knowing you and Uwe, I'm sure you've both
exchanged E-mails about this, and if it had been an easy thing to fix
you would have already nailed it down... ;-)

See ya later..

I guess the design is a matter of taste. I rally wouldn&#65533;t want my computer to look like a toy, but that is me. :) The death of 3.5 disc&#65533;s is maybe not all that good if you want to stay compatible with older systems. In my humble opinion it is still the most convinient way to transfer small files like documents and stuff like that.

I also guess that the G3:s power in itself isn&#65533;t really innovative, and in no ways I know of outperforming a wintel system. With the rather heavy and slow MacOS the G3 don&#65533;t feel all that fast IMO.

>connector,

Nope. The iMac has no externally accesible serial ports. The modem is an internal unit which plugs into the motherboard with a custom connector. The easiest way to get serial ports compatible with the old Mac serial ports is to buy the 2-port KeySpan USB-serial adapter. It doesn't do everything that the built-in serial ports could do (you can't run AppleTalk on it), but for data communication with a ST it will work pretty much exactly like an ordinary Mac serial port.

Try up to 200 MHz for the AMD Athlon. PCI runs at 33 MHz, but that's only for I/O devices, not memory.

>Why not? Intel chips are always quoted at an overclocked speed (hence the
>prodigious use of heatsinking/fans).

Not! It's *users* who overclock Intel chips, not Intel. When Intel prints "400 MHz" on a CPU, they mean that it is intended to run at 400 MHz and has been tested for stable operation at that speed, not that it's really 333 MHz and you should overclock it. In fact, Intel has been taking steps over time to make their chips harder to overclock; for example, the bus multiplier setting is now permanently fixed at the factory, which means that you have to raise the bus speed to force the CPU to run faster than its rating.

A heatsink and a fan is required equipment for any current x86 or compatible CPU, not an optional thing that you only put on when overclocking.

I wouldn't if it made them too slow to use, which was my point (well,
actually I was also referring a bit to the fact that on the Atari many
software packages haven't been updated for years).
Most people only use a small fraction of the functionality of their
software, anyway, so being a version or three behind doesn't hurt much
(unless you need to be able to read files in some new format, obviously).

>> What's so very innovative about the iMac?
>
>USB port for everyone, a nice design, power (G3), integration of the modem, the death of
3.5' disks

Are there modern PCs without USB?
I agree that the iMac looks better than most PCs, but I wouldn't call
that innovation.
As I showed in another article recently, the G3s aren't any better than
the x86 processors on real benchmarks.
There are lots of PCI modems available.
Removing the floppy drive is certainly not my idea of innovation. For new
computer users it might not hurt that much, but if you've been using other
computers for a few years you're likely to have lots and lots of stuff
on floppies.

Please, don't think that I don't like Macs. At work I could chose and on
my desk you'll find a reasonably fast G3 machine (running MkLinux since
I'd rather use Unix than any other operating system (most of my actual
work is done on a Sun workstation)).
At home, I simply can't afford it, so I have a PC instead as my second
machine beside the Falcon/AB040. The PC is mainly used for games and
internet access under Win98 (which is pretty unstable, unfortunately)...

Don't forget the caches!

While the AMD Athlon memory interface (it isn't a bus, actually) is
currently at 200MHz, it can also have a huge second level cache on a
separate channel at 1/3-1/1 (currently 512kbyte at 1/2) of the processor
clock (the Intel Xeon's have various sizes of full speed level two cache
on the processor card, the PII/III 512kbyte half speed cache on card, the
current Celeron's 128kbyte full speed cache on die and the AMD K6-III
256kbyte full speed cache on die, IIRC).

Also, remember that these processors have relatively large internal
level one caches (64*2 kbyte on the AMDs and 32*2 kbyte on Intels, IIRC)
that run at the full processor speed, so they don't even have to access
the second level cache all that often.

You better check you facts before you write down things. The
Tempest will cost ₧200 (UK pound) and the Eclipse the same.
I don't know which currency you have, but that can hardly be
$1100. It's more like $500.

> software, why bother? So he can compile two minutes faster?

Again you havn't checked the facts but are making assumptions.
With the Tempest it will be possible to convert all 68k binaries
to PPC native code and save it to disk giving you a huge speed up.
So your old application will basicly become PPC native
applications. All this is to be read if you want to.

> would like it to be. You doubt the word of the Milan people,

Source record: 76492

: How does one upgrade the TT030's RAM when Atari only sent it out with a
: 4/4 configuration? Advice and stratagies, please.

See the TT030 homepage at http://www.megacom.net/~q-funk/TT030/TT/ .

The best solution is probably the Aixit Magnum TT RAM card. See
http://www.systemsfortomorrow.com who have it in stock at $170 US. It
uses standard FPM or EDO 72-pin SIMMs, and will handle up to 256MB.

A lower-initial-cost option is the Atari 4/16 meg TT RAM board. B&C
Computervisions sells (or sold) them for $100 US. It uses 30 pin SIMMs.
If you're interested, I've got one sitting around, and $100 Canadian will
take it. Why am I not using it? It doesn't work with the 4meg SIMMs I
have, although it does work with the 1meg SIMMs from my older,
non-upgradeable TT RAM card. I'm not sure if it's the SIMMs or if it's my
early-revision TT. Email me if you're interested.

There is a remote chance that I can get my hands on the above grayscale monitor. Does anyone know if it can be connected to the Falcon? All the specs on the 'net seem to be blank about the connector. It seems to be digital input, 1600x1280 res., horizontal scan rate 105 KHz, refresh rate 76 Hz. It gives a very crisp landscape near A3 size display, ideal for non colour DTP.

I agree with Pera (though I think that his speed estimates are a bit
optimistic): the future of Atari may vey well be in emulation.

There is simply no way that any Atari-clone manufacturer can produce machines
competitive with cheap PC-hardware that is produced in millions, and
available even in supermarkets.

So, instead of designing clones destined to be stillborn, it may be more
worthy to concentrate efforts on making a really good Atari-emulator for
the PC-hardware platform. The Atari-clone designers tend to imitate
PC-hardware anyway, with a lot of RAM, PCI slots, IDE interfaces, CD drives,
etc.

I have tried a little of the PaCifiST, TOSbox and the new Gemulator98
Atari emulators. All three work at approximately the same speed (with
negligible differences), and suffer from the same drawbacks:

* Some programs do not work:
There are situations where program X works on one emulator and program Y
does not, while on another emulator program X does not work and program
Y does. Combining all three emulators, all the software I have tried works,
one way or another.

* Screen refresh and mouse movements are slow and jerky:
It seems that the brute force of fast PCs is overcaming this drawback
at last. Maybe writing NVDI screen drivers specific to use with
an emulator might also help, as they may bypass some of the emulation
and go directly to the hardware.

* Floating-point performance is very miserable:
Adding emulation of a floating-point-coprocessor (routing those calls
straight to the real one in the CPU) should not be too difficult,
and that would tremendously boost some serious applications as
Calamus or Dynacadd.

What I am trying to say that, maybe with a team effort, a really good Atari emulator may be just behind the corner, combining the good features of the existing emulators (I admit that they have very different design concepts, but...)

For the moment, the Gemulator seems to me the best candidate for a good emulator. I would prefer, though, an emulator that does not drag the burden of a monstrously large operating system (Windows, that is), even if the emulator is so well designed that this has no speed penalty.

I would like an emulator that operates on DOS stripped off of all things unneeded, maybe keeping just that couple of system files, and some device drivers. So the user may not see the DOS at all- the machine may boot into TOS right away.

Or, maybe, one can dispose of DOS completely, and use just a little of PC BIOS to boot up, and after that dispose even of the BIOS. The compact QNX operating system on the PC does just that, and works perfectly (btw. I hear that the new Amigas, if they ever appear, will have a QNX OS kernel. Maybe QNX kernel is the way to go, it may replace Mint, as both are Unixoid). So, maybe some kind of TOS-for-Intel-CPU might be designed instead of new Atari-clone hardware.

A new version of some TOS-derivative would be needed anyway, to take care of all those interfaces, PCI, etc. So the new de-facto standards and address ranges would have to be declared, as was once the case for the IDE cards for the Atari. Of course, it would be a large project, but much cheaper and easier than design of a complete new computer.

And then, someone may design a nice Fuji-logo sticker to put on the computer box, and one can have a feel of a real Atari, especially if the box has a grey colour :)

Do not think that I enjoy PCs very much, but some degree of 'cooperation with the inevitable' may in fact benefit the Atari users, as all those STs, Megas, TTs and Falcon will die of hardware faults some day, and a live replacement would be needed. After all, it is the software and the hardware capabilities that make a computer, it does not matter much which brand name is on it.

>but how long can you use a PC ?
>6 months ?
>1 year ?
>after 1 year it's totaly outdated, oldies...

This is not a very good argument. Once you make a good configuration that suits your needs, it can run for years, until it dies of old age (as the Atari itself shows). There is no need to replace computers twice a year, like fashion clothes.

In fact, the PC-users that buy a new computer every few months, just to be able to run the latest versions of software monsters for Windows, may be very good for potential Atari-emulator users: very powerful and fast machines, declared as 'obsolete' can be bought second-hand but in perfect

condition for quite a small price.

Cu.

1440. Mega-STe questions.

Newsgroup: comp.sys.atari.st
Date: 1999-07-03 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <377e69888f720b1@holleman.demon.nl>
Source record: 76351

Hi,

well, I opened up the Mega STe, raped the serial-2 connector plus flatcable from it to use it on my TT and found some stuff good enough for questions:

I've got a machine with TOS 2.06, 2 Mb, no co-processor.
HD is a Seagate one. Yup, 40 megs was B-I-G in '91, now I wonder: what can I do with it???

The controller board in the casing for the Seagate, is it a SCSI adapter? It connects to a 50 pin connector. Furthermore, there are 3 dipswitches on the board. These for ID settings or what? I figure so, since all three are "on", thus giving ID 7 for the board... Also, I figure there are no ACSI drives, are there? Well, maybe Atari's own drives. Problem remains that one cannot put Hushi on this disk, since SCSITools won't recognize the drive as a SCSI one. I don't like AHDI, it crashes some oldies that Hushi won't crash... I solved the problem by putting Hushi.sys on the Conner SCSI drive which is second in ID, but Hushi will boot from the first drive on the chain by default and that's the Seagate. Works wonderful... but that way I always need the Conner on the ACSI bus.

How about mem expansion? There's 2 free slots (upper and lower ones), I figure 30 pin SIMMS would do, but does one need to fiddle with the nearby jumpers?

Problem, as usual: I got a nice dutch Owners Manual, which explains there are 2 types of Mega's, 2 and 4 Mb types.
The 2 seals across the bottom screws "break this and you'll loose all guarantee" didn't worry me much, but appearently Atari considered users as dumbo's who can't manage to shove in two extra SIMMS and move around some jumpers... So there's nothing in the manual about it.

How about the floppy drive? This one won't read HD disks... but it might be just a dipswitch setting. Once again, which one was it? Bloody "manual" (wrong word for such a thing) doesn't mention it at all. Users, keep off the screws! Nice little note: even the dipswitch bank has been sealed! You wouldn't believe it until you saw it with your own eyes... :-) Fort Knox is easier to get into...

Nope what?

CAB doesn't know about SSL or NOT, just displays html code "basically"
Now we are talking about the ovl.
And yes, MiNTnet cab ovl does support SSL.
But of course, none of you use MiNT, so you wouldn't know.

Most people here are denying the directions Atari Corp was going.
Remember, as always, Atari Corp always was ahead of their times, MiNT
starts to prove ONCE again this theory.

Thanks for reading.

John, the 5 and 12 volt lines are exactly the same ones as on SCSI-
whatever.
Problem is that all the data lines connect different. In fact the whole 50
(or 68) pin connector connects different.
I've seen statements not to work diff SCSI on a regular (single-end) SCSI
because of possible damage...

You're surprising me: from what I gathered, diff SCSI won't work right on
a single-end bus. At least the IBM 0662 (diff SCSI) didn't work on my TT.
The drive was seen OK, but neither HDDriver, nor Hushi nor ICD-Pro
couldn't work with it.

I know Falcon's SCSI isn't implemented very right, but don't tell me they
got a diff SCSI bus on the Falcon????? Anyway, as long as it works it
saves you a 500 dollar adapter :-)

Hallo Steve!

SD>Zip disks can only be read by Zip drives,

that's true, but isn't this the case for most media?

SD>which have proven to be unreliable.

I have to disagree with this statement. I'm currently operating four Zip drives, 3x SCSI and 1x ATAPI, all of these internal. One of these drives had an electronic failure shortly after I purchesed it, but that was three years ago, and I haven't had any problems since then, neither with the drives nor with the media. Two of the media are used for transporting my messagebase from here to Bubenreuth and back every weekend, and have proven to be perfectly reliable.

SD>Much better to use the LS-120 super floppy.

AFAIK, these are much slower than the Zip drives are, and there is no SCSI version. I don't know of external versions either. They are not bootable unless there is special BIOS support, and it might be impossible to read exotic floppy formats (like "hyperformat" Atari disks) on them.

SD>For bigger back-ups, use a CD-Rewriter rather than some removable hard
SD>drive like a Jaz.

That's perfectly true. Especially with media prices for CD-RW being very low and thus enabling multi-generational backups.

Hi Guys,

Seems I've finished the ethernet driver for Realtek's RTL 8012 pocket adapters. For the last couple weeks I'm using it connected to 2 PCs with 'normal' PCI ethernet cards and transfer files between them using FTP Server on the TT and WS_FTP on the PCs, or WebLight and PC browsers.

STinG's Masquerade also works fine, I can now use our clients for mail and news and Netscape's Communicator or IE for really 'tough' pages ;-)

There are still some problems with STinG's TCP module, especially Trumpet Winsock on the PC side reveals them, I hope Ronald will fix them soon. Anyway, it's a pleasure even with the current version to transfer files from/to PC at 72-75 (some times 93) KB/sec.

STinG driver, schematic diagrams for the small PCB that turns the ROM port to a parallel port and sources for this driver can be found in my homepage "http://users.otenet.gr/~papval/" or the Belgian FTP server "193.190.204.128/atari/network/ethernet/realtek"

I'll try to modify MintNet's de600.xif driver for Dlink adaptors, but if anyone with more MintNet experience can do it, please let me know. (to save me the extra work ;-))

This development resulted also in a faster FTP Server (hmm, I think we need a new name for this program ;-), even for the serial / midi connections. Also in my homepage (V1.07)

Note: I do NOT own two PCs. No way! ;-)

Regards Vassilis papval@otenet.gr

YES, cab, in fact the ovl does support SSL at least if you use the
cab-for-mintnet.ovl

>ahh..
>
>Does Dracnois support SSL? Accessing my hotmail account is vital.

AFAIK, no

>Is there anyway I can do this without resorting to a flamin' PC?

Yes, install MiNT/MiNTnet and use the special SSL cab-for-mintnet.ovl

You can find this ovl at the Belgian ftp-site
ftp://193.190.204.128/atari/mint/www/cab-for-mint_ovl/ssl_18404.ovl.zip

Do you still used 5'1/4 disk in 1990 ?
certainly not, so in 1999 we don't use 3'5 disks, Zip cartgridges are more convenient
sometimes you have to jump to a new standard

G3 power in itself isn't innovative, I agree, but such power at this price is innovative
(before
only Atari and Amiga have done it)
And, absolutely MacOS is a very heavy, old system... but Linux works very well and Mac OS X
will
come soon...
Would you want to use Win2000 ? You need 128mo RAM...

What do you mean with cpu unit? The megast unit itself or only the
internal 68000 cpu chip?
If you mean the chip: 8DM on some electronic stores..
replace the chip is a job for one hour.. ;-)

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 06/26/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 6.00 Advanced Dungeons & Dragons: Heroes of the Lance (SSI)
$ 6.00 Alcon (Taito)
$ 6.00 All Aboard! (Terrific Software)
$ 6.00 Arkanoid (Taito)
$ 4.00 Art & Film Director (Epyx) -- $4.30 shipping, due to
weight, counts as 1st item
$ 6.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 6.00 Battleship (Epyx)
$ 6.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 6.00 Blockout (California Dreams)
$ 6.00 Bobo (Terrific Software)
$ 7.00 Bubble Bobble (Taito)
$ 3.00 California Games (Epyx)
$ 6.00 Championship Wrestling (Epyx)

$ 6.00 Crash Garrett (Metal Hurlant)
$ 6.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Death Sword (Epyx)
$ 2.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 6.00 Dive Bomber (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 6.00 Dynasty Wars (Capcom)
$ 6.00 East vs. West Berlin 1948 (Time Warp)
$ 6.00 Eliminator (Hewson)
$ 6.00 Emperor of the Mines (Impressions)
$ 2.00 Final Assault (Epyx)
$ 6.00 Forecaster III (Greg Kopchak)
$ 3.00 GFL Championship Football (Gamestar)
$ 6.00 Golden Path (Firebird)
$ 6.00 Goldrunner II (Microdeal)
$ 6.00 Hyperdome (Exocet)
$ 6.00 Jewels of Darkness (Firebird)
$ 6.00 Jupiter Probe (Microdeal)
$ 6.00 Keith Van Eron's Pro Soccer (Microplay)
$ 6.00 Knight Orc (Rainbird)
$ 6.00 L.E.D. Storm (Capcom)
$ 2.00 Lands of Havoc (Antic Software)
$ 6.00 Last Duel (Capcom)
$ 6.00 Leander (Psygnosis)
$ 6.00 Major Motion (MichTron)
$ 6.00 Man Hunter: New York (Sierra)
$ 6.00 Man Hunter 2: San Francisco (Sierra)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 6.00 Phantasm (Exocet)
$ 8.00 Planet of Lust (Free Spirit) -- ADULT content!
$ 6.00 Powerstone / Elf Lord's Magic (Starsoft)
$ 2.00 Prime Time (First Row)
$ 6.00 Professor Craps (Scorpio Systems)
$ 6.00 Project Neptune (Epyx)
$ 3.00 Quadralien (Spinnaker)
$ 6.00 Rambo III (Taito)
$ 6.00 Red Lightning (SSI)
$ 3.00 Renegade (Taito)
$ 6.00 Rick Dangerous (Microplay)
$ 6.00 RVF Honda (Microplay)
$ 6.00 Savage (Microplay)
$ 6.00 Silicon Dreams (Firebird)
$ 6.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 6.00 Space School Simulator (CRL Group)
$ 6.00 Star Quake (Terrific Software)
$ 6.00 Starglider (Rainbird)
$ 6.00 StarRay (Logotron Recreation)
$ 6.00 Stunt Track Racer (Microplay)

$ 2.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)
$ 6.00 The Advanced OCP Art Studio (Rainbird)
$ 6.00 The Games (Epyx)
$ 6.00 The Guild of Thieves (Rainbird)
$ 6.00 The Pawn (Rainbird)
$ 6.00 The Sentry (Firebird)
$ 6.00 The Viking Child, Prophecy 1 (Imagitec)
$ 6.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!
$ 6.00 Transputor (CRL Group)
$ 6.00 True BASIC (True Basic Inc.) -- NO SHRINKWRAP!
$ 6.00 Typhoon Thompson: Search for the Sea Child (Br0derbund)
$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 6.00 Wizard's Crown (SSI)
$ 3.00 World Games (Epyx)
$ 3.00 World Karate Championship (Epyx)
$ 6.00 Zero Gravity (Microdeal)
$ 6.00 Zynaps (Hewson)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on weight/distance. Large orders will be weighed as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Source record: 76423

A usergroup *DID* want it, and I wrote on the behalf of that club, The Atari Users of North Texas, on several occations. They were not written on legal letterheads but through E-mail, but then again, a REPLY requesting this would have resulted in a club letterhead (and even the signature of every member if that's what he wanted).

I even invited him to join our club when he retired out of the Atari retail business.

No response... now we have crumpled up bits of Atari hardware and software. It was their stuff afteral, and if that's the fate they wanted for it, that is their choice.

What's done is done. :(

Well, I for one agree with you. I'm excited by just how much "Atari" is alive and kicking... as a game division under Hasbro, as an arcade division, and as a possible computer division in Germany.

Beautiful.

Take it from me. I'm a loyal Newton MessagePad user, and in that "world", there is little hope. We have and use the Newtons because they are VERY useful, and out of practicality, we will use them until they finally fall apart. But the future of the Newton is a bleek one, with no hope of another Newton, no third party Newtons, NOTHING! Apple COMPLETELY killed any idea of continuing the Newton or letting anyone else continue the Newton.

Now to look at ATARI... wow! Seven years later, and Atari-clones are being made by HOW MANY COMPANIES? What's really ironic is that we are probably selling more Ataris now throughout the various companies (Milan, C-LAB, etc...) than we Atari was actually around. ;) (I have a low opinion of the early days of the Atari ST).
People still make software, and hardware. User groups still exist.
And people *LOVE* the old Atari games.

Ladies and gentlemen, the only thing dead about Atari is the company building in California that used to house the Tremmels. But from the earliest days the name "Atari" has been bought and resold.
The fact that "Atari co." is no longer around is showing to mean less and less. The fact is, people are still coming up with some cool stuff

for it.

Granted, not a 500 mhz PC or a G3 iMac, but non-the-less, a computer that still stands DISPITE THE FACT the original company is gone. Macintosh sure as hell couldn't accomplish that, the PC has made a killing off such an existance (spawned from IBM), and Atari are still a loved and trusted by many.

Ah yes, I will welcome the new "Atari" computer. Hell, at $900, I would welcome it, with out without the fuji. (I'll just stencil one on later.) ;)

Go Milan!!

You won't want quadruple '060s -- the price would be astonishing. Better
to use PPCs with 68K emulation. Or failing that, use Coldfires as IAT is
doing for a planned Amiga accelerator. They're using (or at least planning
to use) a custom microkernel to handle the SMP aspect. We'll
see...........
